

High Voltage EL Lamp Driver

Features

- ▶ 1.8 to 6.5V operating supply voltage
- ▶ DC to AC conversion
- ▶ Separately adjustable lamp and converter frequency
- ▶ Output voltage regulation
- ▶ Enable/disable function
- ▶ Patented output timing for high efficiency
- ▶ <100nA shutdown current
- ▶ Split supply capability
- ▶ LCD backlighting

Applications

- ▶ Portable transceivers
- ▶ Remote control units
- ▶ Calculators
- ▶ PDAs
- ▶ Global Positioning Systems (GPS)

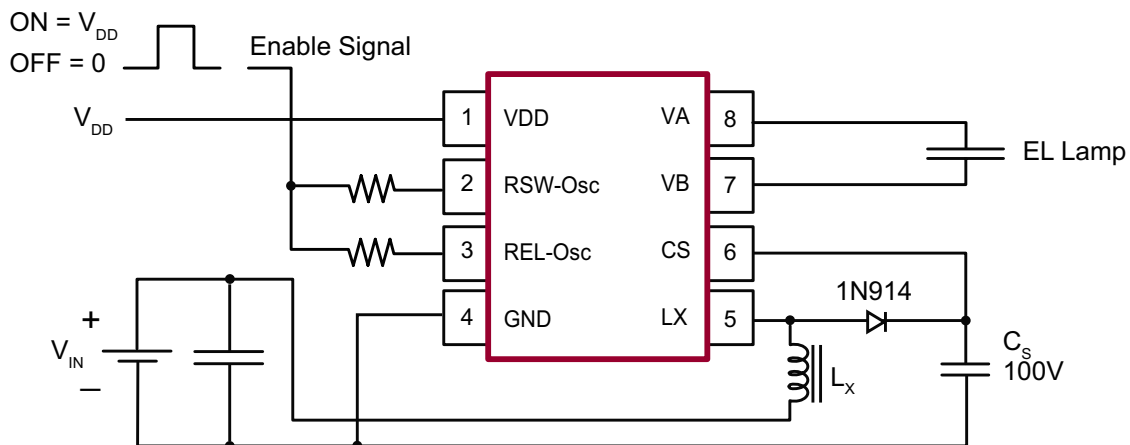

General Description

The Supertex HV833 is a high voltage driver designed for driving EL lamps of up to 35nF (10-12in²). The input supply voltage range is from 1.8 to 6.5V. The device uses a single inductor and a minimum number of passive components. The nominal regulated output voltage that is applied to the EL lamp is ±90V. The chip can be enabled/disabled by connecting a resistor between the RSW-Osc pin and the VDD/GND pins.

The HV833 has two internal oscillators, a switching MOSFET, and a high voltage EL lamp driver. The frequency for the switching MOSFET is set by an external resistor connected between the RSW-Osc pin and the VDD supply pin. The EL lamp driver frequency is set by an external resistor connected between the REL-Osc pin and the VDD pin. An external inductor is connected between the LX pin and VDD or VIN pin. A 0.003-0.1µF capacitor is connected between the CS pin and the GND pin. The EL lamp is connected between the VA pin and the VB pin.

The switching MOSFET charges the external inductor and discharges it into the capacitor at CS. The voltage at CS will start to increase. Once the voltage at CS reaches a nominal value of 90V, the switching MOSFET is turned OFF to conserve power. The outputs VA and VB are configured as an H bridge and are switching in opposite states to achieve 180V peak-to-peak across the EL lamp.

Typical Application Circuit

Ordering Information

Device	8-Lead MSOP 3.00x3.00mm body 1.10mm height (max) 0.65mm pitch
HV833	HV833MG-G

-G indicates package is RoHS compliant ('Green')

Absolute Maximum Ratings

Parameter	Value
Supply voltage V_{DD}	-0.5V to 7.5V
Output voltage, V_{CS}	-0.5V to 125V
Operating temperature	-40°C to +85°C
Storage temperature	-65°C to +150°C
Power dissipation	300mW

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

Recommended Operating Conditions

Sym	Parameter	Min	Typ	Max	Units	Conditions
V_{DD}	Supply voltage	1.8	-	6.5	V	---
f_{EL}	V_{A-B} output drive frequency	60	-	1000	Hz	---
T_A	Operating temperature	-25	-	+85	°C	---

DC Electrical Characteristics (Over recommended operating conditions unless otherwise specified, $T_A = 25^\circ\text{C}$)

Sym	Parameter	Min	Typ	Max	Units	Conditions
$R_{DS(ON)}$	On-resistance of switching transistor	-	-	4.0	Ω	$I = 100\text{mA}$
V_{CS}	Max. output regulation voltage	80	90	100	V	$V_{DD} = 1.8$ to 6.5V
V_{A-B}	Max differential output voltage across lamp	160	180	200	V	$V_{DD} = 1.8$ to 6.5V
I_{DDQ}	Quiescent V_{DD} supply current	-	-	100	nA	$R_{SW-Osc} = \text{Low}$
I_{DD}	Input current going into the VDD pin	-	-	150	μA	$V_{DD} = 1.8$ to 6.5V . See Fig. 1
I_{IN}	Input current including inductor current	-	56	64	mA	$V_{IN} = 3.3\text{V}$. See Fig. 1.
V_{CS}	Output voltage on V_{CS}	63	72	81	V	$V_{IN} = 3.3\text{V}$. See Fig. 1.
f_{EL}	V_{DIFF} output drive frequency	240	270	300	Hz	$V_{IN} = 3.3\text{V}$. See Fig. 1.
F_{SW}	Switching transistor frequency	55	65	75	kHz	$V_{IN} = 3.3\text{V}$. See Fig. 1.
D	Switching transistor duty cycle	-	88	-	%	See Fig. 1.

Typical Performance Curves for Fig. 3 (EL Lamp = 3.0in², $V_{IN} = V_{DD}$)

Enable/Disable Configuration

The HV833 can be easily enabled and disabled via a logic control signal on the R_{SW} and R_{EL} resistors as shown in the Typical Application Circuit on the front page. The control signal can be from a microprocessor. R_{SW} and R_{EL} are typically

very high values. Therefore, only 10's of microamperes will be drawn from the logic signal when it is at a logic high (enable) state. When the microprocessor signal is high the device is enabled and when the signal is low, it is disabled.

Enable/Disable Table

Enable Signal	HV833
V_{DD}	Enable
0V	Disable

Split Supply Configuration for Battery Voltages of Higher than 6.5V

The Typical Application Circuit on the first page can also be used with high battery voltages such as 12V as long as the input voltage, V_{DD} , to the HV833 device is within its speci-

fications of 1.8V to 6.5V. Split supply configuration is shown on Fig. 2.

External Component Description

External Component	Selection Guide Line
Diode	Fast reverse recovery diode, 100V 1N4148 or equivalent.
C_s Capacitor	0.003 μ F to 0.1 μ F, 100V capacitor to GND is used to store the energy transferred from the inductor.
R_{EL-Osc}	The EL lamp frequency is controlled via an external R_{EL} resistor connected between REL-Osc and VDD pins of the device. The lamp frequency increases as R_{EL} decreases. As the EL lamp frequency increases, the amount of current drawn from the battery will increase and the output voltage V_{CS} will decrease. The color of the EL lamp is dependent upon its frequency.
R_{SW-Osc}	The switching frequency of the converter is controlled via an external resistor, R_{SW} between the RSW-Osc and VDD pins of the device. The switching frequency increases as R_{SW} decreases. With a given inductor, as the switching frequency increases, the amount of current drawn from the battery will decrease and the output voltage, V_{CS} , will also decrease.
L_x Inductor	The inductor L_x is used to boost the low input voltage by inductive flyback. When the internal switch is on, the inductor is being charged. When the internal switch is off, the charge stored in the inductor will be transferred to the high voltage capacitor C_s . The energy stored in the capacitor is connected to the internal H-bridge, and therefore to the EL lamp. In general, smaller value inductors, which can handle more current, are more suitable to drive larger size lamps. As the inductor value decreases, the switching frequency of the inductor (controlled by R_{SW}) should be increased to avoid saturation. A 220 μ H Murata (LQH43MN221) inductor with 5.4 Ω series DC resistance is typically recommended. For inductors with the same inductance value but with lower series DC resistance, a lower R_{SW} value is needed to prevent high current draw and inductor saturation.
Lamp	As the EL lamp size increases, more current will be drawn from the battery to maintain high voltage across the EL lamp. The input power, ($V_{IN} \times I_{IN}$), will also increase. If the input power is greater than the power dissipation of the package (300mW), an external resistor in series with one side of the lamp is recommended to help reduce the package power dissipation.
