

## Description

These power modules are a series of high performance, 8-A rated, Integrated Switching Regulators (ISRs), housed in a low cost 14-Pin SIP (Single In-line Package). Operating from either a 3.3 V or 5 V standard power bus, the PT6520 series produces a high-output, low-voltage power source for the industry's latest high-speed, microprocessors, ASICs, \& DSPs. This allows for the easy integration of these new low-voltage ICs into existing 3.3 V or 5 V systems without re-designing the power supply.

The PT6520 series features an output On/Off standby pin and output shortcircuit protection.

## Features

- 8A Rated Output Current
- Single Device: 3.3V/5V Input
- High Efficiency (92\% for PT6521)
- Small Footprint ( 0.75 in $^{2}$, Suffix 'P')
- Output On/Off Standby Control
- Output Short-Circuit Protection
- Adjustable Output Voltage
- Soft Startup
- 16-pin Mount Option (Suffixes L, M, Q, \& F)

Notes: (1) The ISR will operate at no load with reduced specifications.
(2) The STBY* control (pin 3) has an internal pull-up and if it is left open circuit the module will operate when input power is applied. The open-circuit voltage is typically 12.6 V , and maybe as high as 15 V . Refer to the application notes for other interface considerations.
(3) See Safe Operating Area curves or contact the factory for the appropriate derating.
(4) The tab pins on the 16-pin mount package types (suffixes $L$ \& $M$ ) must be soldered. For more information see the applicable package outline drawing.

Input/Output Capacitors: The PT6520 series requires a $330 \mu \mathrm{~F}$ capacitor at both the input and output for proper operation in all applications. In addition, the input capacitance ( $C_{i n}$ ) must be rated for a minimum of 1.2 Arms ripple current rating. For transient or dynamic load applications, additional output capacitance ( $C_{\text {out }}$ ) may be necessary. The maximum allowable output capacitance is $5,000 \mu F$. For more information consult the related application note on capacitor recommendations.

Characteristic Data; $\mathbf{V}_{\mathbf{i n}}=\mathbf{5 . 0 V}$ (See Note A)

Output Ripple vs Output Current

Safe Operating Area; $\mathbf{V}_{\mathbf{i n}}=\mathbf{5 V}$ (See Note B)

Characteristic Data; $\mathbf{V}_{\mathbf{i n}}=\mathbf{3 . 3 V}$ (See Note $A$ )

Safe Operating Area; 3.3V (See Note B)

Note A: Characteristic data bas been developed from actual products tested at $25^{\circ} \mathrm{C}$. This data is considered typical data for the Converter.
Note B: SOA curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures

## Using the Standby Function of the PT6520 Series of Integrated Switching Regulators

The PT6520 series of power modules are high efficiency regulators that operate off either a 3.3 V or 5 V input bus voltage. These regulators incorporate a Standby function, which may be used in applications that require power-up/shutdown sequencing, and wherever there is a requirement for the output status of the module to be controlled by external circuitry.

The standby function is provided by the $S T B Y^{*}$ control, pin 3. If pin 3 is left open-circuit 1 the regulator operates normally, and provides a regulated output when a valid supply voltage is applied to $\mathrm{V}_{\text {in }}$ (pins 4-6) with respect to GND (pins 7-10). If a low voltage 2 is then applied to pin 3 the regulator output will be disabled and the input current drawn by the ISR will be reduced to about $15 \mathrm{~mA}^{3}$. The standby control may also be used to hold-off the regulator output during the period that input power is applied.

Pin 3 is ideally controlled with an open-collector (or opendrain) discrete transistor (See Figure 1). The open-circuit voltage is typcially 12.6 V . Table 1 gives the circuit parameters for this control input.

Table 1 Standby Control Requirements ${ }^{(2,3)}$

| Parameter | Min | Typ | Max |
| :--- | :---: | :---: | :---: |
| Input Low $\left(\mathrm{V}_{\mathrm{IL}}\right)$ | -0.1 V |  | +0.4 V |
| $\mathrm{I}_{\text {stby }}$ (pin $3=$ ground $)$ |  | -0.5 mA |  |
| $\mathrm{~V}_{\text {stby }}$ (open circuit) |  | 12.6 V | 15 V |

## Notes:

1 The standby control input requires no external pull-up resistor. The open-circuit voltage of the STBY* pin is typically 12.6 V .
2. The standby control input is $\underline{N o t}$ compatible with TTL or other devices that incorporate a totem-pole output drive. Use only a true open-collector device, preferably a discrete bipolar transistor (or MOSFET). To ensure the regulator output is disabled, the control pin must be pulled to less than 0.4 Vdc with a low-level 0.5 mA sink to ground.
3. When the regulator output is disabled the current drawn from the input source is typically reduced to 15 mA .

Figure 1

Turn-On Time: In the circuit of Figure 1, turning $\mathrm{Q}_{1}$ on applies a low voltage to the STBY control (pin 3) and disables the regulator ouput. Correspondingly, turning $\mathrm{Q}_{1}$ off removes the low-voltage signal and enables the output. Once enabled, the output will typically experience a $10-15 \mathrm{~ms}$ delay followed by a predictable ramp-up of voltage. The regulator should provide a fully regulated output voltage within 40 ms . The waveform of Figure 2 shows the output voltage and input current waveforms of a PT6521 (3.3V) following the turn-off of $\mathrm{Q}_{1}$. The turn off of $\mathrm{Q}_{1}$ corresponds to the rise in Vstby. The waveforms were measured with a 5 Vdc input voltage, and 4.5 A resistive load.

Figure 2

## Adjusting the Output Voltage of the PT6520 Series of Integrated Switching Regulators

The output voltage of the PT6520 series of integrated switching regulators (ISRs) may be adjusted higher or lower than the factory trimmed pre-set voltage with the addition of a single external resistor. 1 Table 1 gives the allowable adjustment range for each model in the series as $\mathrm{V}_{\mathrm{a}}(\min )$ and $\mathrm{V}_{\mathrm{a}}(\max )$.

Adjust Up: An increase in the output voltage is obtained by adding a resistor $\mathrm{R}_{2}$, between pin 14 ( $\mathrm{V}_{\mathrm{o}}$ adjust) and pins 7-10 (GND).

Adjust Down: Add a resistor $\left(\mathrm{R}_{1}\right)$, between pin $14\left(\mathrm{~V}_{\mathrm{o}}\right.$ adjust) and pin $1 \mathrm{~V}_{\mathrm{o}}$ (sense) 3 .

Refer to Figure 1 and Table 2 for both the placement and value of the required resistor, either $\left(\mathrm{R}_{1}\right)$ or $\mathrm{R}_{2}$ as appropriate.

The values of (R1) [adjust down], and R2 [adjust up], can also be calculated using the following formulas.

$$
\begin{aligned}
& \left(\mathrm{R}_{1}\right)=\frac{\mathrm{R}_{\mathrm{o}}\left(\mathrm{~V}_{\mathrm{a}}-\mathrm{V}_{\mathrm{r}}\right)}{\mathrm{V}_{\mathrm{o}}-\mathrm{V}_{\mathrm{a}}}-\mathrm{R}_{\mathrm{s}} \mathrm{k} \Omega \\
& \mathrm{R}_{2}=\frac{\mathrm{R}_{0} \cdot \mathrm{~V}_{\mathrm{r}}}{\mathrm{~V}_{\mathrm{a}}-\mathrm{V}_{\mathrm{o}}}-\mathrm{R}_{\mathrm{s}} \mathrm{k} \Omega
\end{aligned}
$$

Where: $V_{o}=$ Original output voltage
$V_{a}=$ Adjusted output voltage
$\mathrm{V}_{\mathrm{r}}=$ The reference voltage (Table 1)
$\mathrm{R}_{\mathrm{o}}=$ The multiplier resistance (Table 1)
$\mathrm{R}_{\mathrm{s}}=$ The internal series resistance (Table 1)

Figure 1

## Notes:

1. Use only a single $1 \%$ resistor in either the $\left(R_{1}\right)$ or $R_{2}$ location. Place the resistor as close to the ISR as possible.
2. Never connect capacitors from $V_{o}$ adjust to either GND, V ${ }_{\text {out }}$, or the Remote Sense pin. Capacitance added to the $V_{o}$ adjust pin will affect the stability of the ISR.
3. If the Remote Sense feature is not being used, the resistor $\left(\mathrm{R}_{1}\right)$ may be connected between pin $14\left(\mathrm{~V}_{\mathrm{o}}\right.$ adjust) and pins 11-13 ( $\mathrm{V}_{\text {out }}$ ).
4. Adjusting the output voltage of the PT6523 (2.5V model) higher than the factory pre-trimmed output voltage may increase the minimum input voltage specified for the part. This model must comply with the following requirements.

PT6523:
$\mathrm{V}_{\mathrm{in}}(\min )=\left(\mathrm{V}_{\mathrm{a}}+0.5\right) \mathrm{V}$ or 3.1 V , whichever is greater.

## Capacitor Recommendations for the PT6520 Series of Integrated Switching Regulators

## Input Capacitors:

The recommended input capacitance is determined by 1.0 ampere minimum ripple current rating and $330 \mu \mathrm{~F}$ minimum capacitance ( $300 \mu \mathrm{~F}$ for Oscon® or low ESR tantalum). Ripple current and $<100 \mathrm{~m} \Omega$ equivalent series resistance (ESR) values are the major considerations, along with temperature, when designing with different types of capacitors. Tantalum capacitors have a recommended minimum voltage rating of $2 \times$ the maximum DC voltage +AC ripple. This is necessary to insure reliability for input voltage bus applications

## Output Capacitors:

The ESR of the required capacitor ( $\mathrm{C}_{\text {out }}$ ) must not be greater than $150 \mathrm{~m} \Omega$. Electrolytic capacitors have poor ripple performance at frequencies greater than 400 kHz but excellent low frequency transient response. Above the ripple frequency, ceramic capacitors are necessary to improve the transient response and reduce any high frequency noise components apparent during higher current excursions. Preferred low ESR type capacitor part numbers are identified in Table 1.

## Tantalum Capacitors

Tantalum type capacitors may be used for the output but only the AVX TPS series, Sprague 593D/594/595 series or Kemet T495/T510 series. These capacitors are recommended over many other tantalum types due to their higher rated surge, power dissipation, and ripple current capability. As a caution the TAJ series by AVX is not recommended. This series has considerably higher ESR, reduced power dissipation, and lower ripple current capability. The TAJ series is less reliable than the AVX TPS series when determining power dissipation capability. Tantalum or Oscon ${ }^{\circledR}$ types are recommended for applications where ambient temperatures fall below $0^{\circ} \mathrm{C}$.

## Capacitor Table

Table 1 identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The number of capacitors required at both the input and output buses is identified for each capacitor type.

This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The RMS ripple current rating and ESR (Equivalent Series Resistance at 100 kHz ) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design. PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

## OBSOLETE: TI has discontinued the production of the device

${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): Tl's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annal basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.
TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in Tl's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.
TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.
Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.
In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, Tl's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.
No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.
Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
