1. Introduction

ILI9163 is a 262,144-color one-chip SoC driver for a-TFT liquid crystal display with resolution of 132RGBx162 dots, comprising a 396-channel source driver, a 162-channel gate driver, 48,114bytes GRAM for graphic data of 132RGBx162 dots, and power supply circuit.

The ILI9163 supports 18-/16-/9-/8-bit data bus interface and serial peripheral interfaces (SPI). The moving picture area can be specified in internal GRAM by window address function. The specified window area can be updated selectively, so that moving picture can be displayed simultaneously independent of still picture area.

ILI9163 can operate with 1.65V I/O interface voltage, and an incorporated voltage follower circuit to generate voltage levels for driving an LCD. The ILI9163 also supports a function to display in 8 colors and a sleep mode, allowing for precise power control by software and these features make the ILI9163 an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP where long battery life is a major concern.

2. Features

- ◆ Display resolution: [132xRGB](H) x 162(V)
- ◆ Output:
 - 396 source outputs
 - 162 gate outputs
 - Common electrode output
- ◆ AM-LCD driver with on-chip full display RAM: 48,114 bytes
- ◆ MCU Interface
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 8080-series MCU
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 6800-series MCU
 - 3-pin/4-pin serial interface
- ◆ Display mode:
 - Full color mode (idle mode off): 262K-colors
 - Reduced color mode (idle mode on): 8-colors (3-bits MSB bits mode)
- ◆ On chip functions:
 - VCOM generator and adjustment
 - Timing generator
 - Oscillator
 - DC/DC converter
 - 8 preset gamma curve selectable
 - Line/frame inversion
 - MTP to store initialization register setting
 - Factory default value(Contrast, Module ID, Module version, etc) are stored on the display module
- ◆ MTP:
 - 7-bits for ID2

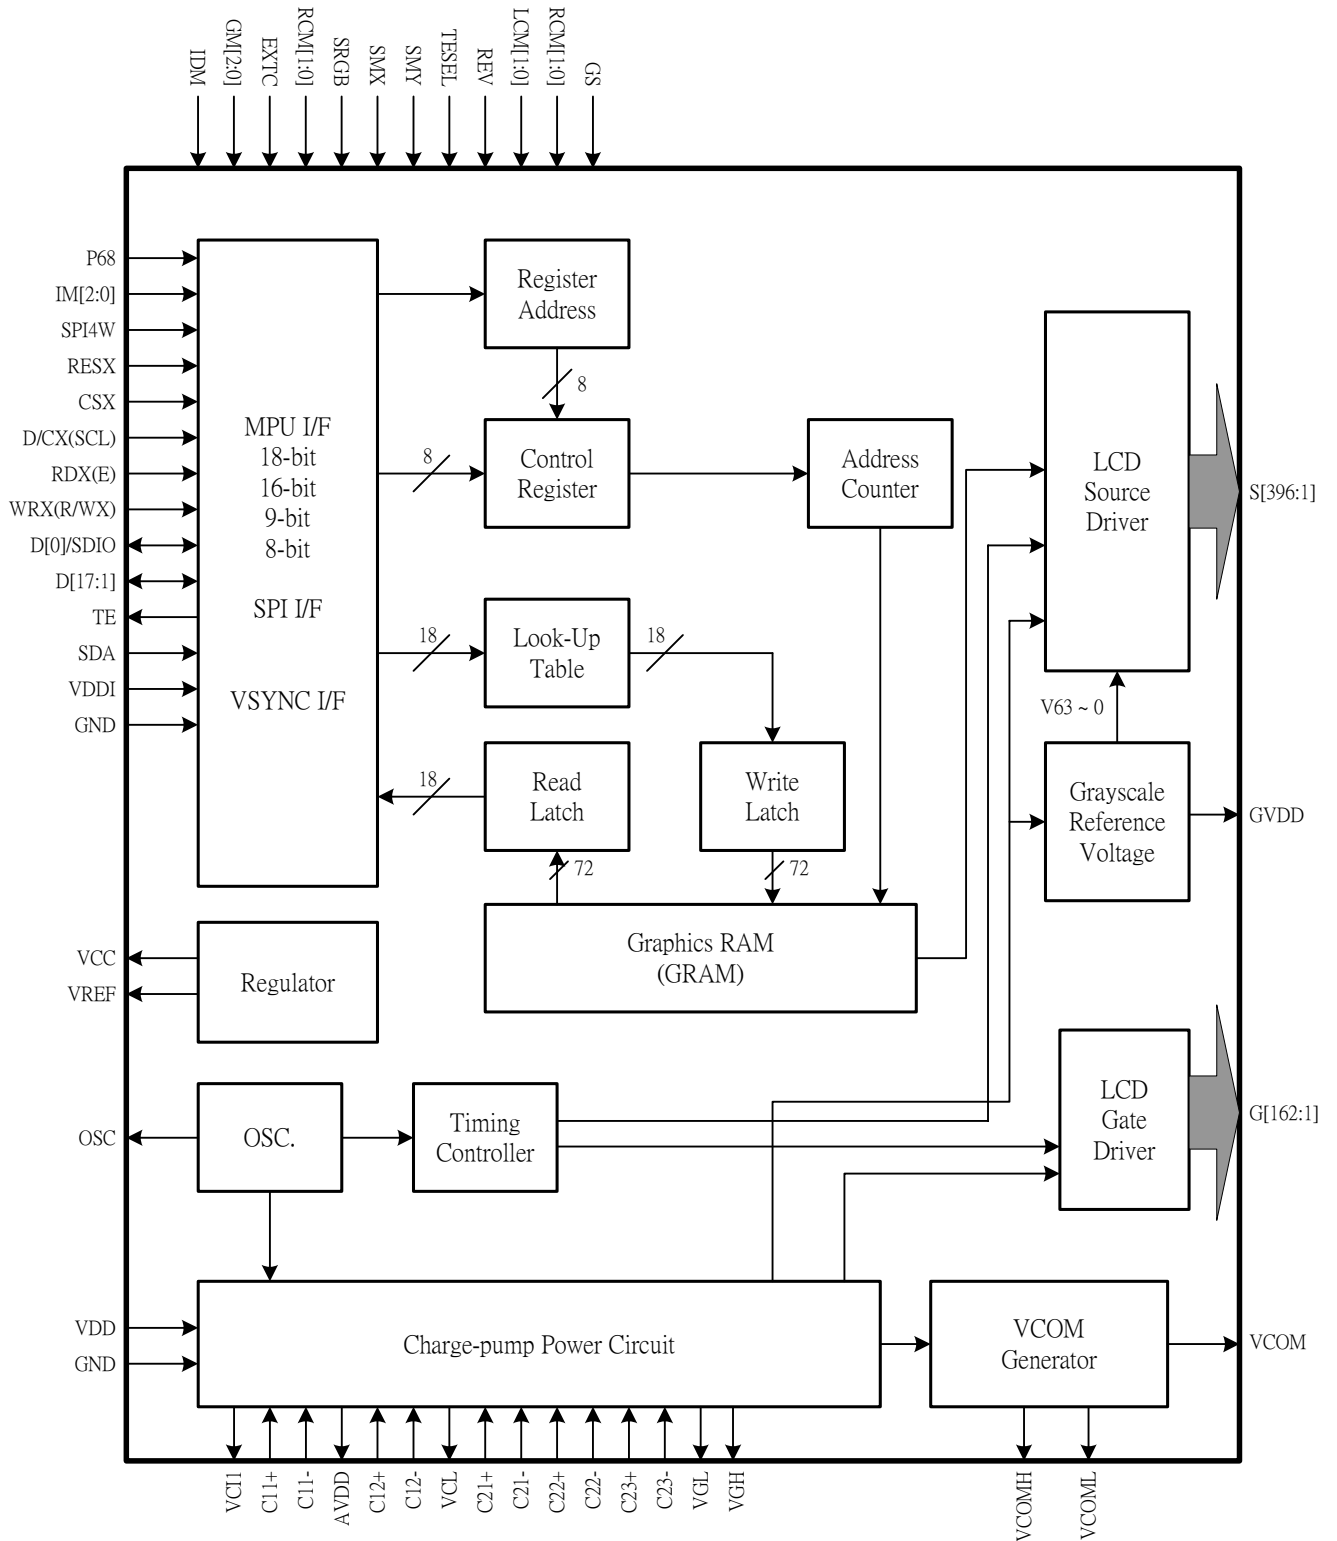

- 8-bits for ID3
- 7-bits for VCOM adjustment

- ◆ Low –power consumption architecture
 - Low operating power supplies:
 - VDDI = 1.65V ~ 3.3 V (interface I/O)
 - VDD = 2.6V ~ 3.3 V (analog)

- ◆ LCD Voltage drive:
 - Source/VCOM power supply voltage
 - AVDD – GND = 4.5V ~ 6.0
 - VCL – GND = -1.0V ~ -3.0V
 - VDD – VCL \leq 6.0V
 - Gate driver output voltage
 - VGH – GND = 10V ~ 16V
 - VGL – GND = -9V ~ -16V
 - VGH – VGL \leq 32V
 - VCOM driver output voltage
 - VCOMH = 2.5V ~5V
 - VCOML = -2.5V ~ 0V
 - VCOMH-VCOML \leq 6.0V

- ◆ Operate temperature range: -40°C to 85°C

3. Block Diagram

4. Pin Descriptions

Pin Name	I/O	Descriptions															
P68	I	8080/6800 MCU Interface mode selection. P68='1': select 6800-MCU parallel interface P68='0': select 8080-MCU parallel interface If not used, please fix this pin at GND level.															
IM2	I	MCU Parallel interface bus and Serial interface select - IM2='1';Parallel Interface - IM2='0';Serial Interface															
IM1, IM0	I	MCU parallel interface type selection <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>IM1</th> <th>IM0</th> <th>Parallel interface</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>MCU 8-bit Parallel</td> </tr> <tr> <td>0</td> <td>1</td> <td>MCU 16-bit Parallel</td> </tr> <tr> <td>1</td> <td>0</td> <td>MCU 9-bit Parallel</td> </tr> <tr> <td>1</td> <td>1</td> <td>MCU 18-bit Parallel</td> </tr> </tbody> </table>	IM1	IM0	Parallel interface	0	0	MCU 8-bit Parallel	0	1	MCU 16-bit Parallel	1	0	MCU 9-bit Parallel	1	1	MCU 18-bit Parallel
IM1	IM0	Parallel interface															
0	0	MCU 8-bit Parallel															
0	1	MCU 16-bit Parallel															
1	0	MCU 9-bit Parallel															
1	1	MCU 18-bit Parallel															
SPI4W	I	SPI interface selection pin SPI4W='0': 3-wire SPI. (default) SPI4W='1': 4-wire SPI. This pin is internal pull low.															
RESX	I	Chip reset pin ("Low Active"). This signal low will reset the device and must be applied to properly initialize the chip.															
CSX	I	Chip select input pin ("Low" enable). This pin can be permanently fixed "Low" in MCU interface mode only.															
D/CX (SCL)	I	Display data / Command selection pin in parallel and SCL in 3-pin SPI interface. D/CX='1': Display data. D/CX='0': Command data. If not used, please connect this pin to GND.															
RDX (E)	I	Read enable in 8080-parallel interface and Read/ Write operation enable pin in 6800-parallel interface. If not used, please connect this pin to GND.															
WRX (R/Wx)(D/CX)	I	Write enable in parallel interface. WRX: for 8080 MCU R/WX: for 6800 MCU D/CX: for 4-wire SPI If not used, please connect to ground or VDDI this pin.															
D[17:1] D[0]/SDIO	I/O	When RCM='0' (MCU I/F), D[17:0] are used to MCU parallel interface data bus, and D0 is also the serial input/ output signal in SPI interface mode. In serial interface, D[17:1] are not used and should be connected to ground.															
TE	O	Tearing effect output pin to synchronies MCU to frame writing, activated by S/W command. When this pin is not activated, this pin is low.															

Pin Name	I/O	Descriptions																												
		If not used, please open this pin.																												
SDA	I/O	When RCM[1:0]= '0X' (MCU I/F), This pin is not used, and fix at GND level. -If it's not used, please fix this pin at GND level.																												
OSC	O	Oscillator output or test purpose.																												
EXTC	I	To use extended command set, please connect this pin to VDDI. During normal operation, please open this pin. (It has an internal pull low resistor.) EXTC='1', all the command can be used. EXTC='0', only Command (00h~3Ah, Dah~DCh) can be used																												
IDM	I	Normal mode and Idle mode control pin <table border="1"> <thead> <tr> <th>IDM</th> <th>Idle mode H/W controller</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Normal display (can be changed to Idle mode by S/W)</td> </tr> <tr> <td>1</td> <td>Into Idle mode</td> </tr> </tbody> </table>	IDM	Idle mode H/W controller	0	Normal display (can be changed to Idle mode by S/W)	1	Into Idle mode																						
IDM	Idle mode H/W controller																													
0	Normal display (can be changed to Idle mode by S/W)																													
1	Into Idle mode

G1 ~ G162	O	Gate driver output pins.																							
VDD	P	Power supply to liquid crystal power supply analog circuit. Connect to external power supply (VDD=2.5~3.3V).																							
VDDI	P	VDDI voltage level for interface control pins.																							
VCC	P	Power supply for internal logic regulator.																							
GND	P	GND voltage output level for control pins.																							

Pin Name	I/O	Descriptions
VDDIO	P	VDDI voltage output level for control pins using.
GNDO	P	GND voltage output level for control pins using.
VC11	I/O	A reference voltage in step-up circuit 1 Connect a capacitor for stabilization
AVDD	P	A power output pin for source driver block that is generated from power block. Output of booster 1 circuit (output of 2-times output of VC11) Connect a capacitor for stabilization.
VCL	P	A power supply pin for generating VCOML Connect a capacitor for stabilization
VREF	-	Floating pin. Leave this pin as open.
GVDD	P	A standard level for grayscale voltage generator. Connect a capacitor for stabilization.
VGH	P	Positive voltage of the Booster circuit Connect a capacitor for stabilization
VGL	P	Negative voltage of the Booster circuit 3 Connect a capacitor for stabilization
VCL	P	Power supply to drive VCOML. Connect a capacitor for stabilization
C11+, C11-, C12+, C12-	O	Make sure to connect to capacitor that is used in internal step-up circuit 1.
C21+, C21-, C22+, C22-, C23+, C23-	O	Make sure to connect to capacitor that is used in internal step-up circuit 2. Connect to capacitors according to the step-up factors in use.
VCOM	O	TFT display common electrode power supply. Alternates between voltage levels between VCOMH-VCOML. Registers set the alternating cycle. Registers set the alternating cycle and operate or halt VCOM.
VCOMH	O	Positive voltage output of VCOM Connect a capacitor for stabilization
VCOML	O	Negative voltage output of VCOM Connect a capacitor for stabilization
DUMMY_TEST DUMMY_TESTOSC	I	These test pins for Driver vender test used. Please open these pins or fix to GND.
DUMMY_TESTDA[6:0] DUMMY_VPRER_OUT	O	These test pins for Driver vendor test used. Please open these pins.
DUMMYR1-DUMMYR2	-	DUMMYR1 and DUMMYR2 are short-circuited within the chip for COG contact resistance measurement. Please leave them open when not used.
DUMMY1-DUMMY18	-	-These pins are dummy (not have any function inside) -Can have signal traces pass through on TFT glass under the PAD

Liquid crystal power supply specifications Table 1

No.	Item	Description	
1	TFT Source Driver	396 pins (132 x RGB)	
2	TFT Gate Driver	162 pins	
3	TFT Display's Capacitor Structure	Cst structure only (Common VCOM)	
4	Liquid Crystal Drive Output	S1 ~ S396	V0 ~ V63 grayscales
		G1 ~ G162	VGH – VGL
		VCOM	VCOMH – VCOML: Amplitude = electronic volumes
5	Input Voltage	VDDI	1.65 ~ 3.30V
		VDD	2.60 ~ 3.30V
6	Liquid Crystal Drive Voltages	AVDD	4.5V ~ 6.0V
		VGH	10V ~ 16V
		VGL	-9V ~ -16V
		VCL	-1.7V ~ -2.7V
		VGH – VGL	Max. 32V
		VDD – VCL	Max. 6.0V
7	Internal Step-up Circuits	AVDD	VC11 x2
		VGH	VC11 x4, x5, x6
		VGL	VC11 x-3, x-4, x-5
		VCL	VC11 x-1

5. Pad Arrangement and Coordination

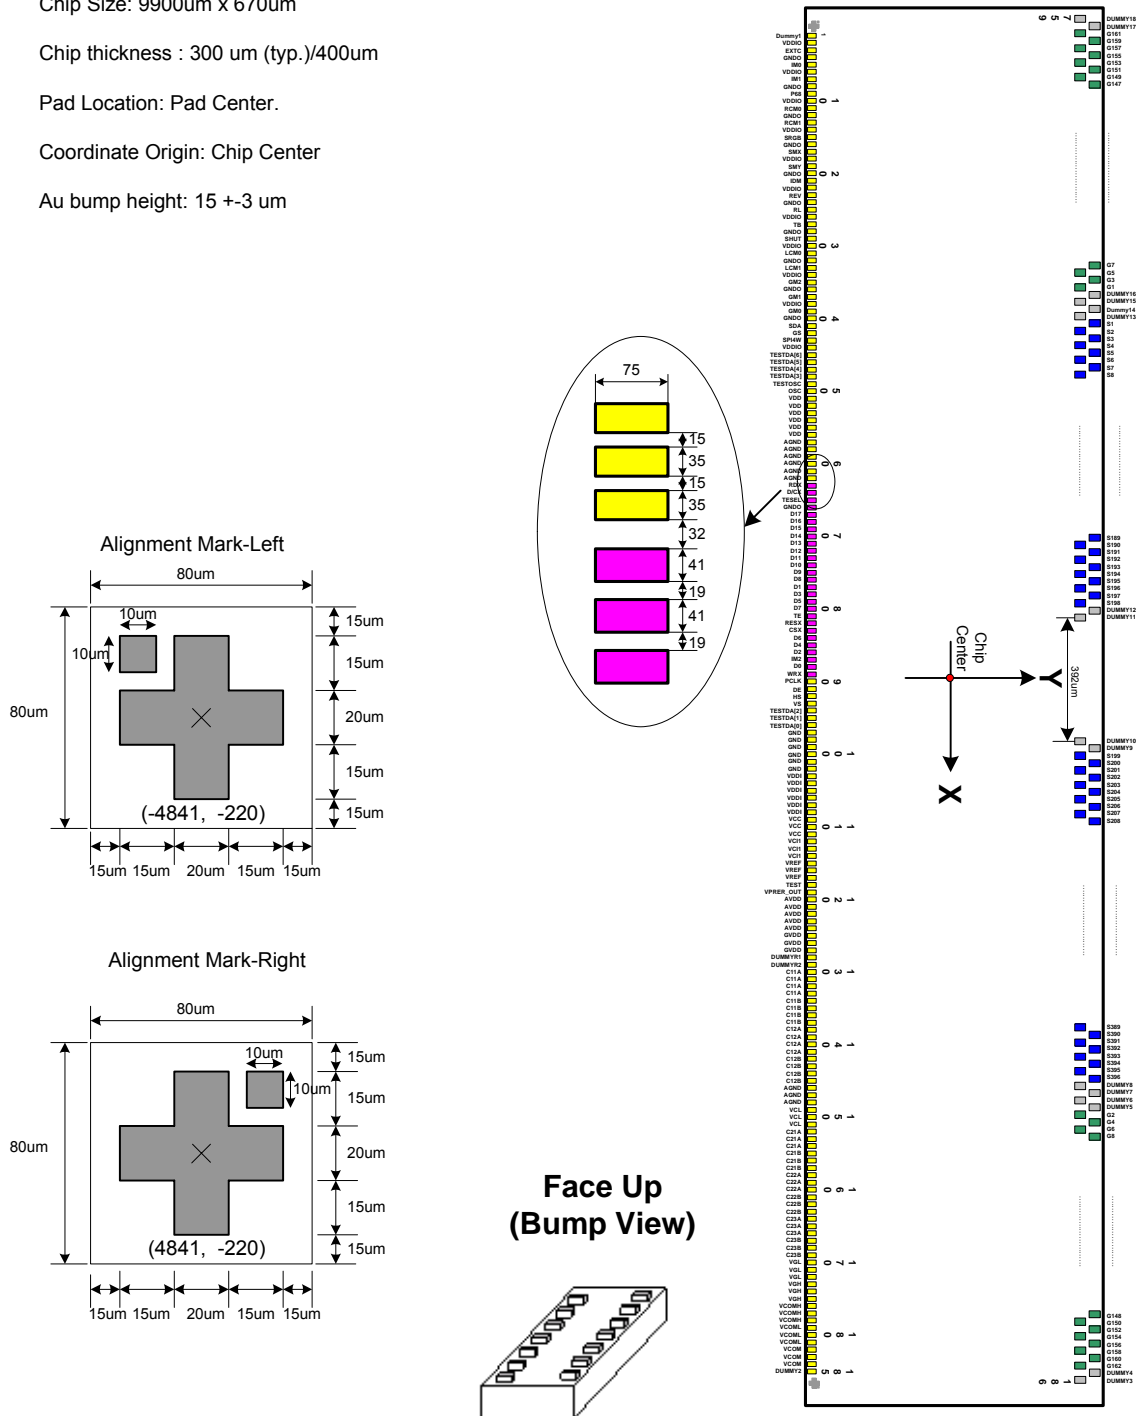

Chip Size: 9900um x 670um

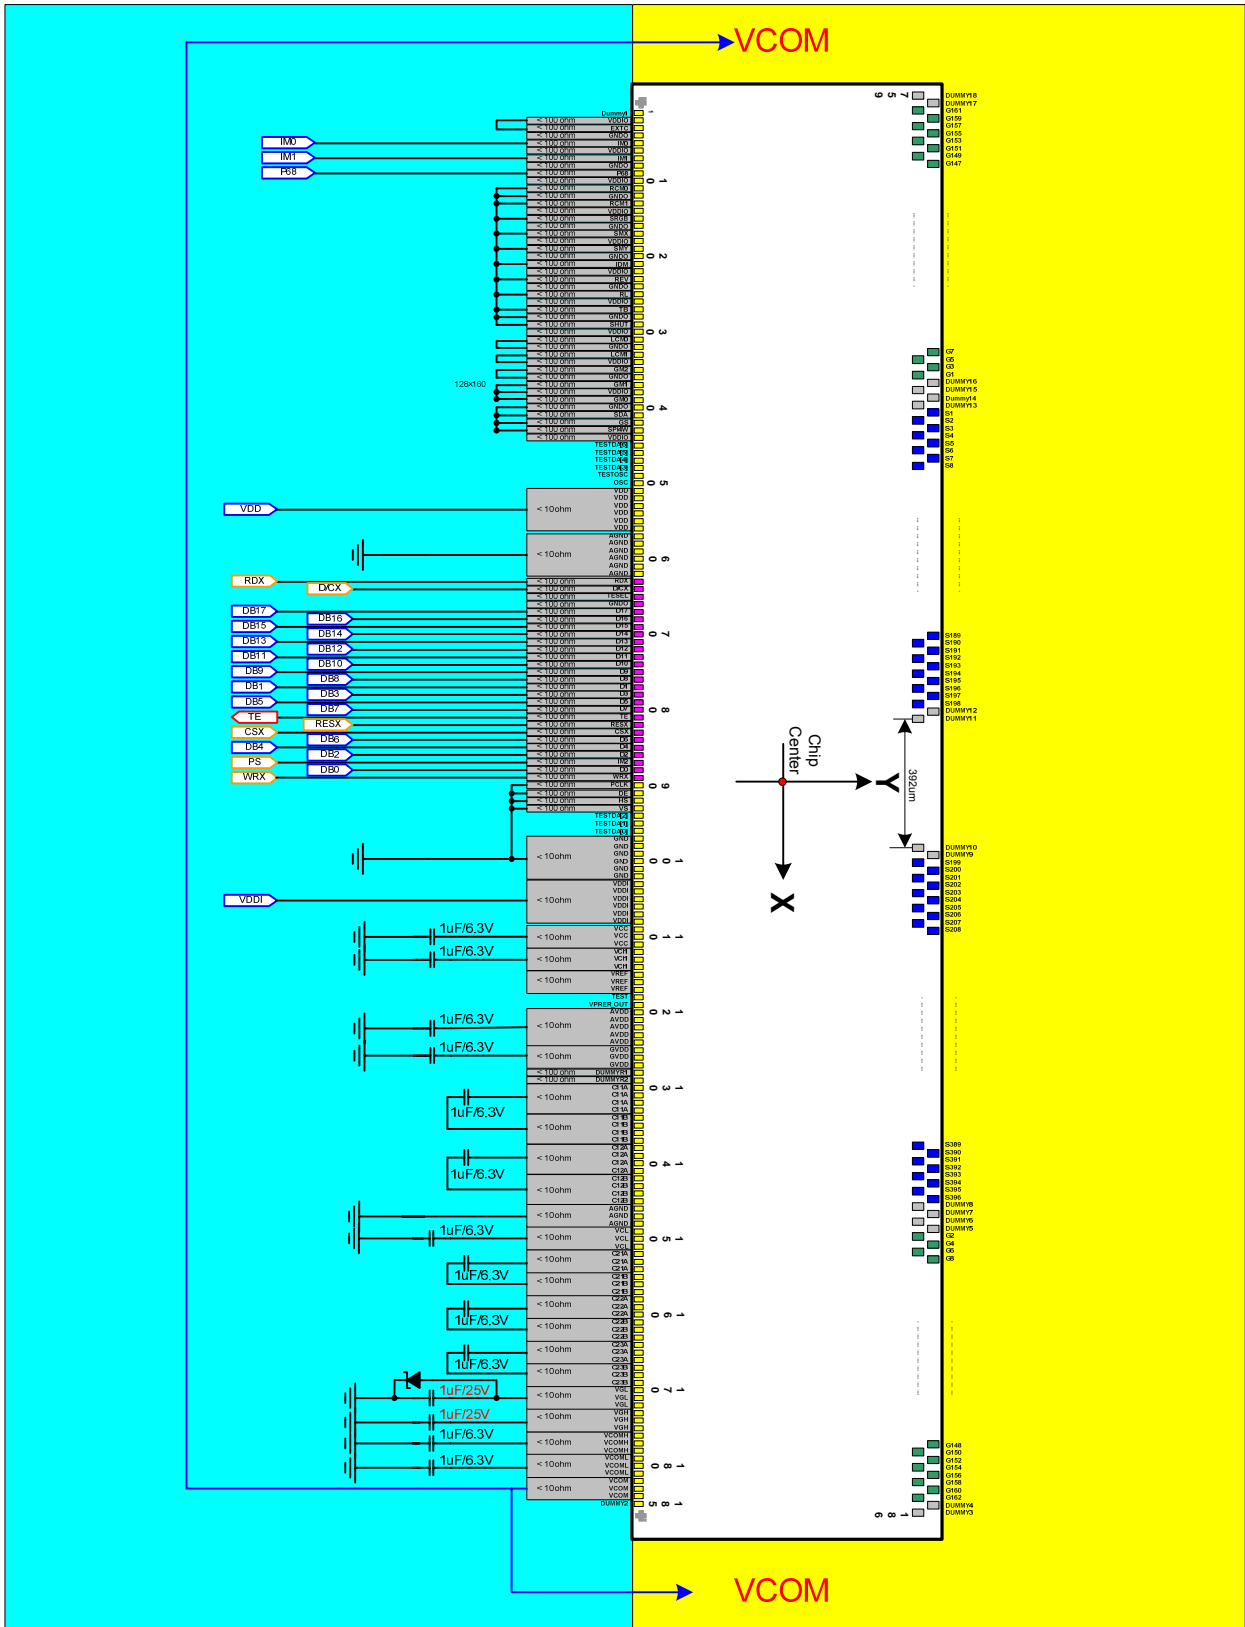

Chip thickness : 300 um (typ.)/400um

Pad Location: Pad Center.

Coordinate Origin: Chip Center

Au bump height: 15 +/-3 um

6. Function Description

6.1. MCU Interface Type Selection

The selection of a given interfaces are done by setting P68, IM2, IM1, and IM0 pins as show in below tables.

Table 6.1.1 MCU Interface Type Selection

P68	IM2	IM1	IM0	Interface	Read back selection
-	0	-	-	Serial interface	Via the read instruction (12-bit, 16-bit and 18-bit read parameter)
0	1	0	0	8080 MCU 8-bit Parallel	RDX strobe(8-bit read data and 8-bit read parameter)
0	1	0	1	8080 MCU 16-bit Parallel	RDX strobe(16-bit read data and 8-bit read parameter)
0	1	1	0	8080 MCU 9-bit Parallel	RDX strobe(9-bit read data and 8-bit read parameter)
0	1	1	1	8080 MCU 18-bit Parallel	RDX strobe(18-bit read data and 8-bit read parameter)
-	0	-	-	Serial interface	Via the read instruction (12-bit, 16-bit and 19-bit read parameter)
1	1	0	0	6800 MCU 8-bit Parallel	E strobe(8-bit read data and 8-bit read parameter)
1	1	0	1	6800 MCU 16-bit Parallel	E strobe(9-bit read data and 8-bit read parameter)
1	1	1	0	6800 MCU 9-bit Parallel	E strobe(16-bit read data and 8-bit read parameter)
1	1	1	1	6800 MCU 18-bit Parallel	E strobe(18-bit read data and 8-bit read parameter)

6.2. Serial Interface

The Module uses a 3-wire 9-bit serial interface or 4-pins/8bits bi-directional interface for communication between the micro controller and the LCD driver chip. The 3-pin serial use: CSX (chip enable), SCL(serial clock) and SDA(serial data input/output) and the 4-pins serial use: CSX(chip enable), D/XC(data/ command select), SCL(serial data input/output). Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

Table 7.2.1 Serial Interface Type Selection

IM2	4WSPI	Interface	Read back selection
0	0	3-Pins Serial Interface	Via the read instruction(8-bits, 24-bits and 32-bits read parameter)
0	1	4-Pins Serial Interface	Via the read instruction(8-bits, 24-bits and 32-bits read parameter)

6.2.1 Command Write

The write mode of the interface means the micro controller writes commands and data to the LCD driver. 3-Pins serial data packet contains a control bit D/CX and a transmission byte and in 4-pins serial case, data packet contains just transmission byte and control bit D/CX is transferred by the D/CX pin. If D/CX is "low", the

transmission byte is interpreted as a command byte. If D/CX is “high”, the transmission byte is stored in the display data RAM (Memory write command), or command register as parameter.

Any instruction can be sent in any order to the Driver. The MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicated the start of data transmission.

Figure5: 3-pins Serial Data Stream Format

Figure6: 4-pins Serial Data Stream Format

When CSX is “high”, SCL clock is ignored. During the high time of CSX the serial interface is initialized. At the falling edge of CSX, SCL can be high or low. SDA is sampled at the rising edge of CSX. D/CX indicates, whether the byte is command code (D/CX=’0’) or parameter/RAM data (D/CX=’1’). It is sampled when first rising edge of SCL (3-pin serial interface) or 8th rising edge of SCL (4-pins serial interface). If CSX stays low after the last bit of command/data byte, the serial interface expects the D/CX bit (3-pin serial interface) or D7(4-pins serial interface) of the next byte at the next rising edge of SCL.

6.2.2 Read Function

Figure7: 3-Pin Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command:

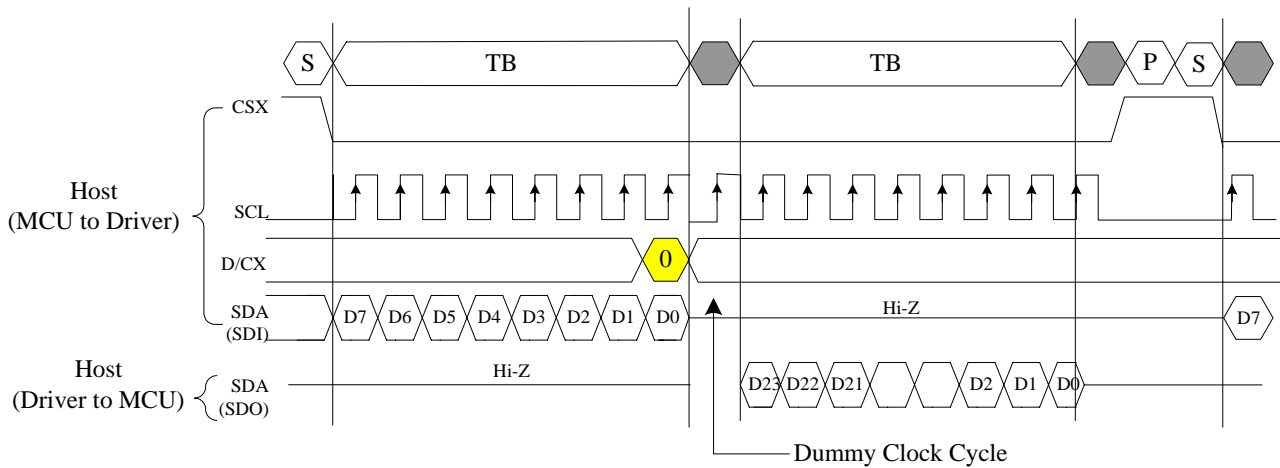

Figure11: 4-pins Serial Protocol (for RDID command: 24-bits read)

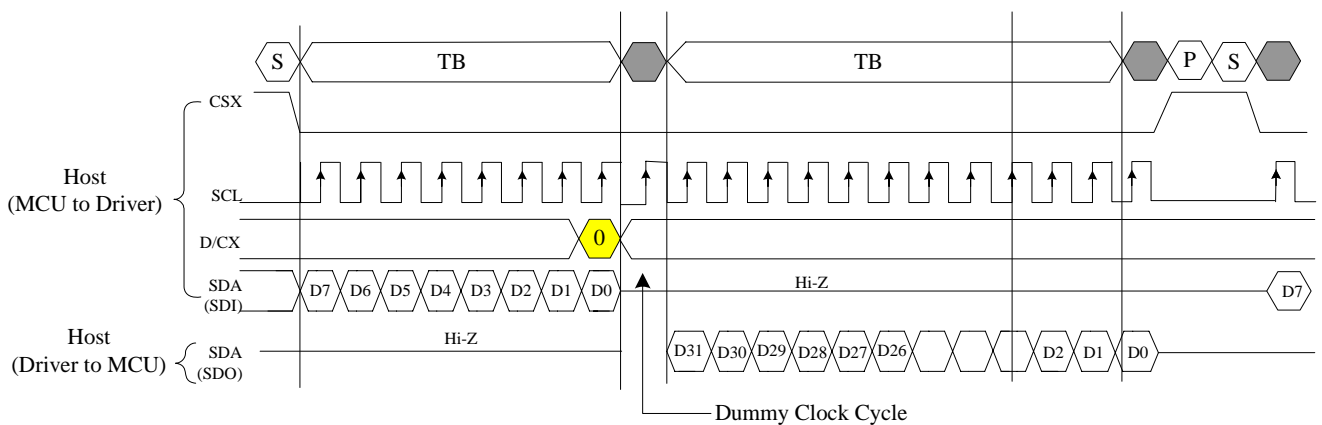

Figure12: 4-pins Serial Protocol (for RDST command: 32-bits read)

6.3. 8080-Series Parallel Interface (P68='0')

The MCU uses a 11-wires 8-data parallel interface or 12-wires 9-data parallel interface or 19-wires 16-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX (active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. WRX is the parallel data write, RDX is the parallel data read and D[17:0] is parallel data.

The graphics controller chip reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17,0] bits are display RAM data or command parameters. When D/C='0', D[17,0] bits are commands.

The 8080-series bi-direction interface can be used for communication between the micro controller and LCD driver chip. The selection of this interface is done when P68 pin is low state (GND). Interface bus width can be selected with IM2, IM1 and IM0. The interface function of 8080-series parallel interface are given in Table 8.2.4

Table 7.2.4 The function of 8080-series parallel interface

P68	IM2	IM1	IM0	Interface	D/CX	RDX	WRX	Function
0	1	0	0	8-bit Parallel	0	1	↑	Write 8-bit command(D7 to D0)
					1	1	↑	Write 8-bit display data or 8-bit parameter(D7 to D0)
					1	↑	1	Read 8-bit display data(D7 to D0)
					1	↑	1	Read 8-bit parameter or status(D7 to D0)
0	1	0	1	16-bit Parallel	0	1	↑	Write 8-bit command(D7 to D0)
					1	1	↑	Write 16-bit display data or 8-bit parameter(D15 to D0)
					1	↑	1	Read 16-bit display data(D15 to D0)
					1	↑	1	Read 8-bit parameter or status(D7 to D0)
0	1	1	0	9-bit Parallel	0	1	↑	Write 8-bit command(D7 to D0)
					1	1	↑	Write 9-bit display data or 8-bit parameter(D8 to D0)
					1	↑	1	Read 9-bit display data (D8 to D0)
					1	↑	1	Read 8-bit parameter or status(D7 to D0)
0	1	1	1	18-bit Parallel	0	1	↑	Write 8-bit command(D7 to D0)
					1	1	↑	Write 18-bit display data or 8-bit parameter(D17 to D0)
					1	↑	1	Read 18-bit display data(D17 to D0)
					1	↑	1	Read 8-bit parameter or status(D7 to D0)

Note: applied for command code: Dah, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh

6.3.1 Write Cycle/Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control (D/CX, RDX, WRX) and data signals (D[17...0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are a command if the control signal is low (= '0') and vice versa it is data (= '1'). The write cycle is described in the following figure.

Note: WRX is an unsynchronized signal (it can be stopped)

Figure13: 8080-Series WRX Protocol

Figure14: 8080-Series Parallel bus protocol (write to register or display RAM)

6.3.2 Read Cycle/Sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from the display via interface. The display sends data (D[17...0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

Note: RDX is an unsynchronized signal (It can be stopped).

Figure15: 8080-Series RDX Protocol

Figure16: 8080-Series parallel bus protocol (Read from register or display RAM)

6.4. 6800-Series Parallel Interface (P68='1')

The MCU uses a 11-wires 8-data parallel interface or 12-wires 9-data parallel interface or 19-wires 16-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX(active low) enables and disables the parallel interface. RESX(active low) is an external reset signal. WRX is the parallel data write, RDX is the parallel data read and D[17:0] is parallel data.

The Graphics Controller Chip reads the data at the falling edge of E signal when R/WX='1' and writes the data at the falling of the E signal when R/WX='0'. The D/CX is the data/command flag. When D/CX='1', D[17,0] bits are display RAM data or command parameters. When D/C='0', D[17,0] bits are commands.

The 6800-series bi-direction interface can be used for communication between the micro controller and LCD driver chip. The selection of this interface is done when P68 pin is high state (VDDI). Interface bus width can be selected with IM2, IM1 and IM0. The interface function of 6800-series parallel interface are given in Table 8.2.7

Table 7.2.7 The function of 6800-series parallel interface

P68	IM2	IM1	IM0	Interface	D/CX	RDX	WRX	Function
1	1	0	0	8-bit Parallel	0	1	↓	Write 8-bit command(D7 to D0)
					1	1	↓	Write 8-bit display data or 8-bit parameter(D7 to D0)
					1	↓	1	Read 8-bit display data(D7 to D0)
					1	↓	1	Read 8-bit parameter or status(D7 to D0)
1	1	0	1	16-bit Parallel	0	1	↓	Write 8-bit command(D7 to D0)
					1	1	↓	Write 16-bit display data or 8-bit parameter(D15 to D0)
					1	↓	1	Read 16-bit display data(D15 to D0)
					1	↓	1	Read 8-bit parameter or status(D7 to D0)
1	1	1	0	9-bit Parallel	0	1	↓	Write 8-bit command(D7 to D0)
					1	1	↓	Write 9-bit display data or 8-bit parameter(D8 to D0)
					1	↓	1	Read 9-bit display data (D8 to D0)
					1	↓	1	Read 8-bit parameter or status(D7 to D0)
1	1	1	1	18-bit Parallel	0	1	↓	Write 8-bit command(D7 to D0)
					1	1	↓	Write 18-bit display data or 8-bit parameter(D17 to D0)
					1	↓	1	Read 18-bit display data(D17 to D0)
					1	↓	1	Read 8-bit parameter or status(D7 to D0)

Note : applied for command code : Dah, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh

6.4.1 Write Cycle/Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (E low-high-low sequence) consists of 3 control (D/CX, E, R/WX) and data signals (D[17...0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are a command if the control signal is low (= '0') and vice versa it is data (= '1'). The write cycle is described in the following figure.

Note: E is unsynchronized signal (it can be stopped)

Figure17: 6800-Series Write Protocol

Figure18: 6800-Series parallel bus protocol (write to register or display RAM)

6.4.2 Read Cycle/Sequence

The read cycle means that the host reads information (command or/and data) to the display via the interface. Each read cycle (E low-high-low sequence) consists of 3 control (D/CX, E, R/WX) and data (D[17...0]). D/CX bit is control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (=‘0’) and vice versa it is data (=‘1’)

Note: E is an unsynchronized signal (It can be stopped).

Figure19: 6800-Series Read Protocol

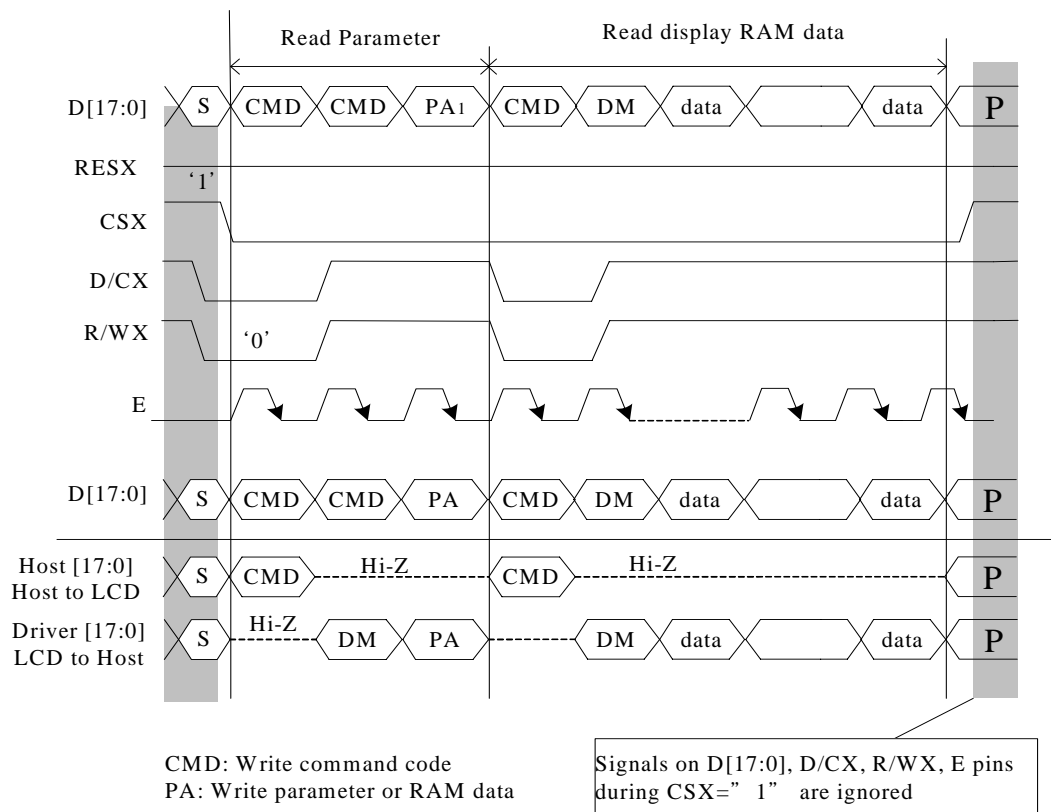

Figure20: 6800-Series Parallel bus protocol (Read from register or display RAM)

6.5. Display Data Transfer Recovery

If there is a break in data transmission by RESX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then DRIVER will reject the previous its and have reset the interface such that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been High state. See the following example.

Figure21: Serial bus protocol, write mode – interrupted by RESX

If there is a break in data transmission by CSX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command data, before Bit D0 of the byte has been completed. Then the DRIVER will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line(CSX) is next activated. See the following example.

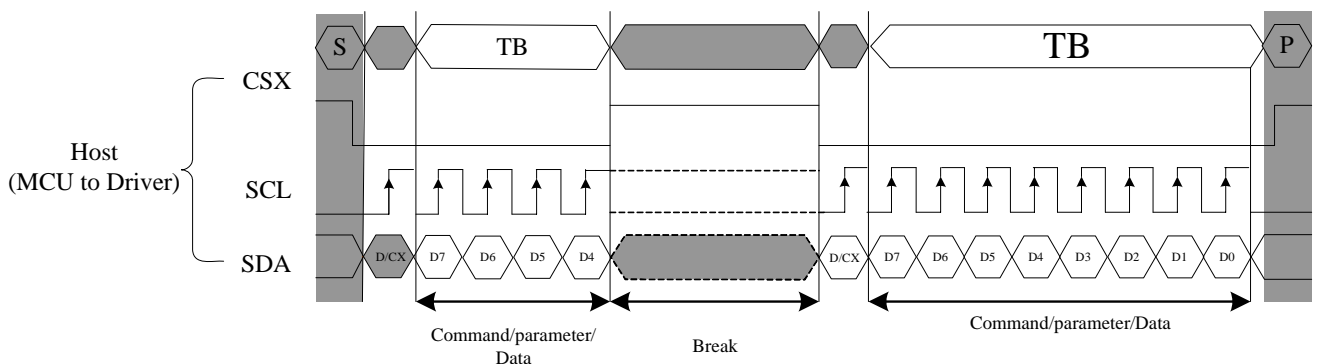

Figure22: Serial bus protocol, write mode – interrupted by CSX

If 1, 2 or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The inter face is ready to receive next byte as show below.

Note: Break can be e.g. another command or noise pulse.

6.6. Display Data Transfer Pause

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select Line is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then the Display Module will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select Line is released after a whole byte of a command has been completed, then the Display Module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below:

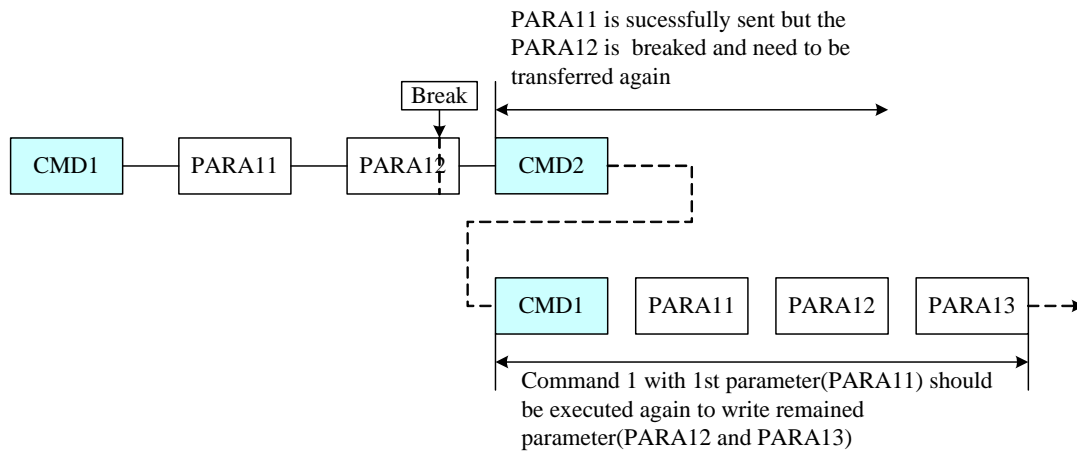

Figure23: Write interrupts recovery (serial interface)

If 1, 2 or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of command remains previous value.

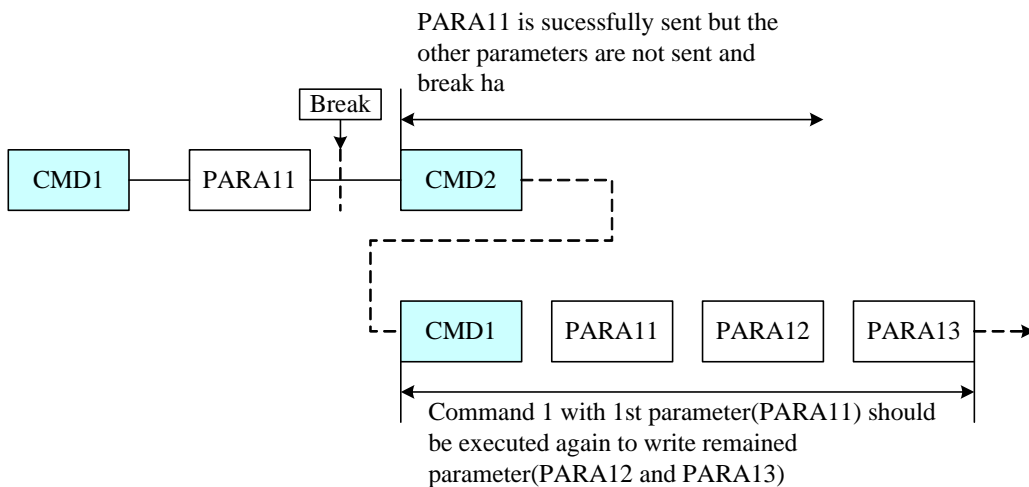

Figure24: Write interrupts recovery (both serial and parallel interface)

6.6.1 Serial Interface Pause

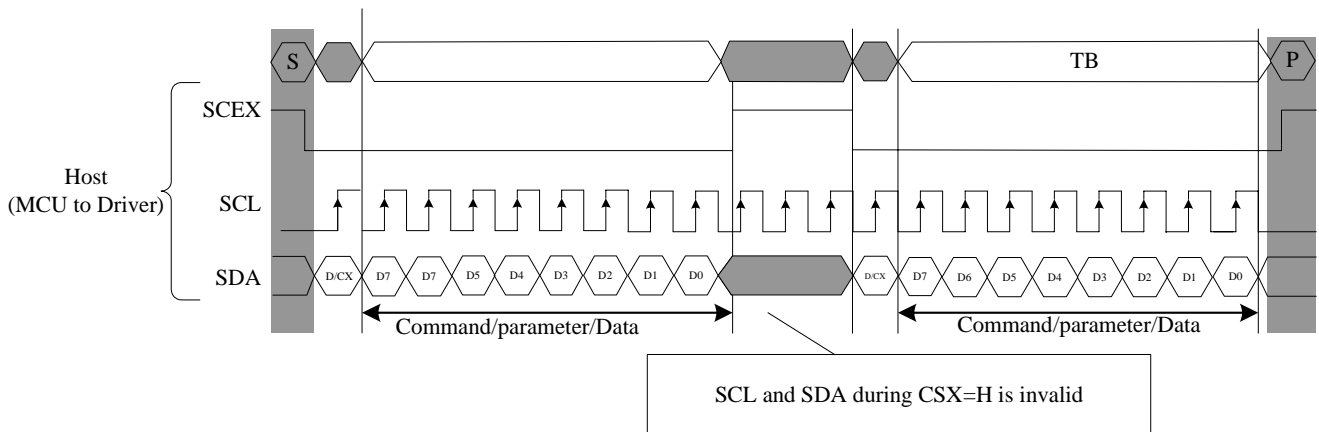

Figure25: Serial interface Pause Protocol (pause by CSX)

Figure26: Parallel bus Pause Protocol (paused by CSX)

This applies to the following 4 conditions:

1. Command-Pause-Command
2. Command-Pause-Parameter
3. Parameter-Pause-Command
4. Parameter-Pause-Parameter

6.7. Display Data Transfer Mode

The Module has three kinds color modes for transferring data to the display RAM. These are 12-bit color per pixel, 16-bit color per pixel and 18-bit color per pixel. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

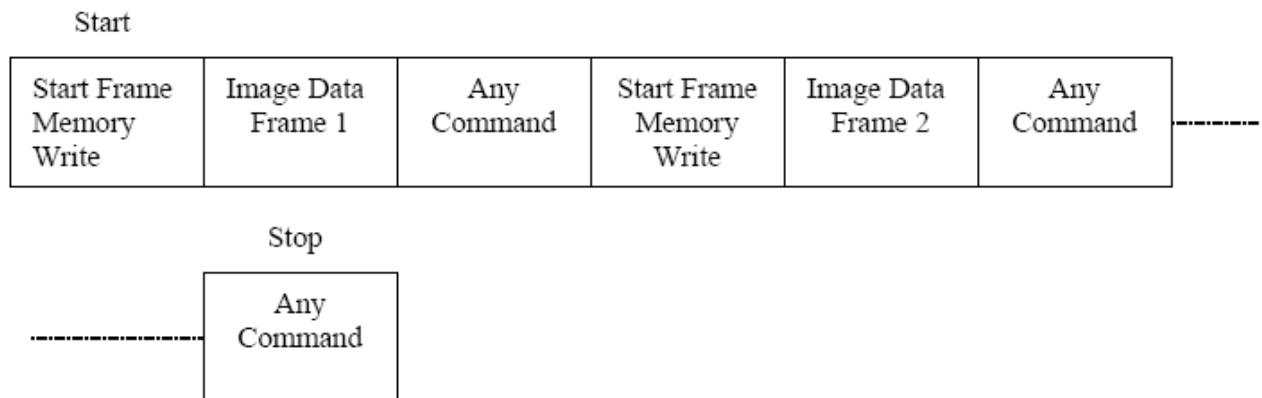

Method 1:

The Image data is sent to the Frame Memory in successive Frame writes, each time the Frame Memory is filled, the Frame Memory pointer is reset to the start point and the next Frame is written.

Method 2:

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Write. Then Start Memory Write command is sent, and a new Frame is downloaded.

Note:

1. These apply to this Data Transfer Color mode on both Serial and Parallel interfaces.
2. The Frame Memory can contain both odd and even number of pixels for both Methods. Only complete pixel data will be stored in the Frame Memory.

6.8. Display Data Color Coding

6.8.1 Serial Interface

Different display data formats are available for three colors depth supported by the LCM listed below.

- ✧ 4k colors, RGB 4-4-4-bits input
- ✧ 65K colors, RGB 5-6-5-bitsinput
- ✧ 262K colors, RGB 6-6-6-bits input

Note 1: pixel data with the 12-bits color depth information.

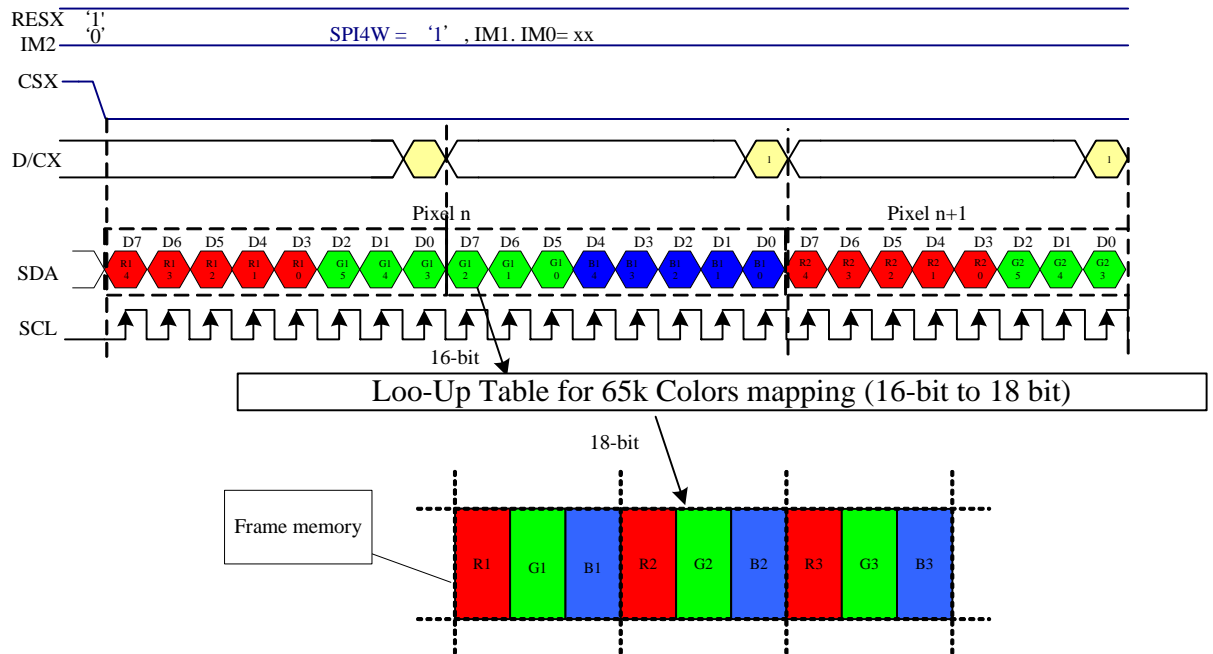

Note 2: The most significant bits are: Rx³, Gx³ and Bx³

Note 3: The least significant bits are:Rx⁰, Gx⁰ and Bx⁰

Note 4: X = don't care – Can be set to '0' or '1'

Figure27: Write data for RGB4-4-4 bits input

4-pin 8-bit Series data protocol

Note 1: pixel data with the 16-bits color depth information.

Note 2: The most significant bits are: Rx⁴, Gx⁵ and Bx⁴

Note 3: The least significant bits are:Rx⁰, Gx⁰ and Bx⁰

Note 4: X = Don't care – Can be set to '0' or '1'

7. Display Data RAM

7.1. Configuration

The display data RAM stores display dots and consists of 384,504 bits (132x18x162 bits). There is no restriction on access to the RAM even when the display data on the same address is loaded to DAC.

There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

7.3. MCU to memory write/read direction (Address Counter)

The address counter set the addresses of the display data RAM for writing and reading.

Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected(RGB 6-6-6-bit), according to the data formats. As soon as this pixel-data information is complete the "Write access" is activated on the RAM. The locations of RAM are addressed by the address pointers. When GM=011, 132RGB x 162, the address ranges are X=0 to X=131 (83h) and Y=0 to Y=161 (A1h). Addresses outside these ranges are not allowed. Before writing to the RAM a window must be defined into which will be written. The window is programmable via the command register XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0(0h) YS=0(0h) and XE=131(83h), YE=161(A1h)

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address(X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS)

For flexibility in handling a wide variety of display architectures, the commands "CASET, RASET" and "MADCTR", define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Below table shows the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data must be rewritten to the display RAM.

For each image orientation, the controls for the column and page counters apply as below: -

Condition	Column Counter	Row Counter
When RAMWR/RAMRD command is accepted	Return to "Start Column (XS)"	Return to "Start Row (YS)"
Complete Pixel Read/Write action	Increment by 1	No change
The Column counter value is larger than "End Column(XE)"	Return to "Start Column (XS)"	Increment by 1
The Column counter value is larger than "End Column (XE)" and the Row counter value is larger than "End Row(YE)"	Return to "Start Column (XS)"	Return to "Start Row (YS)"

Figure42: Frame Data Write Direction According to the MADCTR parameters (MV, MX and MY)

Display Data Direction	MADCTR Parameter			Image in the Memory (MPU)	Image in the Driver (DDRAM)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
XY Exchange	1	1	0		
XY Exchange	1	1	1		

8. Tearing Effect Output Line

The Tearing Effect output line supplies to the MCU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect Signal is defined by the Parameter of the Tearing Effect Line On command.

The signal can be used by the MCU to synchronize Frame Memory Writing when displaying video images.

8.1. Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Sync information only:

t_{vdh} = The LCD display is not updated from the Frame Memory.

T_{vdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see below).

Mode 2, the Tearing Effect Output signal consists of V-Sync and H-Sync information, There is one V-sync and 162 H-sync pulses per field:

t_{hdh} = The LCD display is not updated from the Frame Memory.

T_{hdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see above).

Note: During Sleep In Mode, the Tearing Effect Output Pin is active Low.

8.2. Tearing Effect Line Timing

The Tearing Effect signal is described below:

Table 8.2.1 AC characteristics of Tearing Effect Signal Idle Mode Off/On (Frame Rate = 58.9Hz)

Symbol	Parameter	min	max	unit	description
t _{vdl}	Vertical Timing Low Duration	13	-	Ms	
t _{vdh}	Vertical Timing High Duration	1000	-	μs	
t _{hdl}	Horizontal Timing Low Duration	33	-	μs	
t _{hdh}	Horizontal Timing High Duration	25	500	μs	

Notes:

1. The timings in Table 8.3.1 apply when MADCTL B4=0 and B4=1
2. The signal's rise and fall times (t_f, t_r) are stipulated to be equal to or less than 15ns.

Figure43: Rise and fall times

The Tearing Effect Output Line is fed back to the MCU and should be used as shown below to avoid Tearing Effect:

8.2.1 Example 1 MCU Write is Faster than Panel Read

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

8.2.2 Example 2 MCU Write is slower than Panel Read

The MCU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync

pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MCU to Frame memory write position.

9. Power ON/OFF Sequence

VDDI and VDD can be applied in any order.

VDD and VDDI can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, VDD and VDDI must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VDD can be powered down minimum 0msec after RESX has been released.

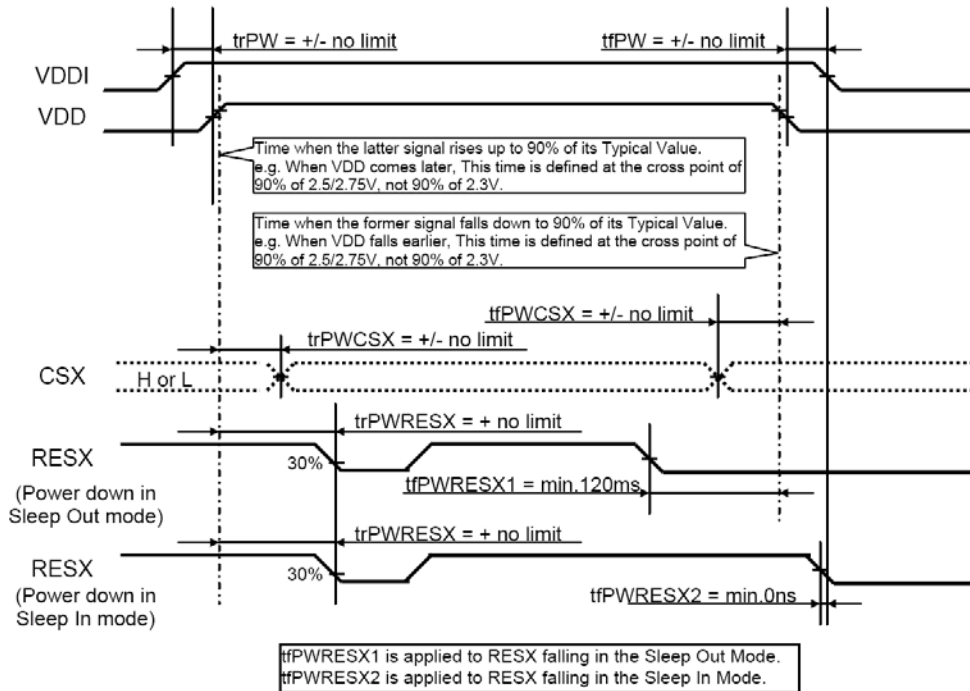

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

Notes:

1. There will be no damage to the display module if the power sequences are not met.
2. There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.
3. There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.
4. If RESX line is not held stable by host during Power On Sequence as defined in Sections 8.5.1 and 8.5.2, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

9.1. Case 1 – RESX line is held high or Unstable by Host at Power –On

If RESX line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both VDD and VDDI have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

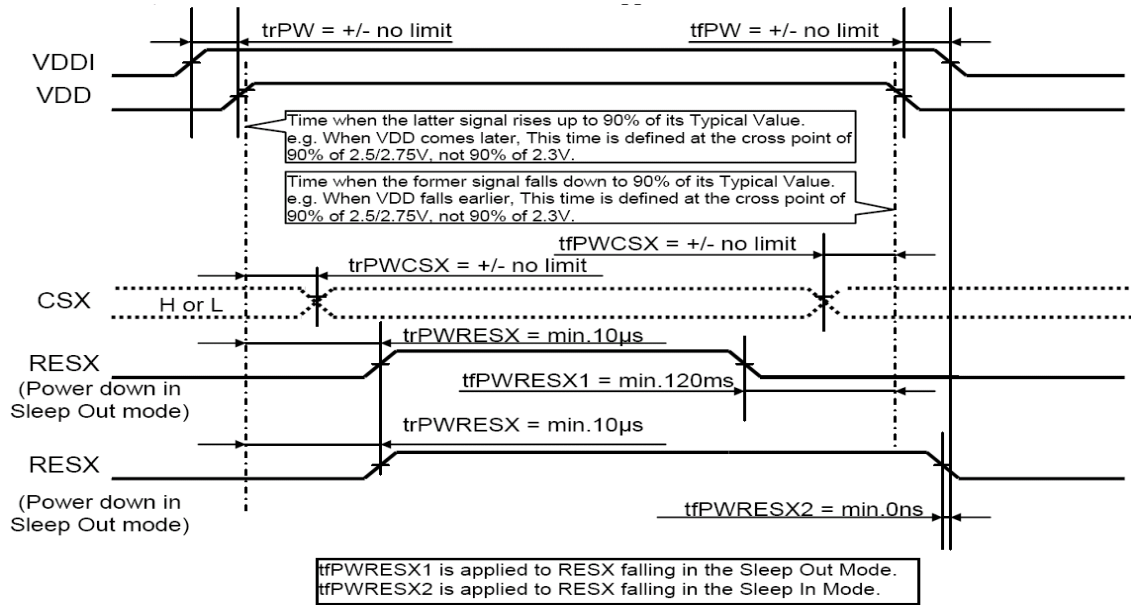

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

9.2. Case 2 – RESX line is held Low by Host at Power On

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum

10μsec after both VDD and VDDI have been applied.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

9.3. Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. The display module must meet following requirements:

1. There cannot be any damages for the display module or the display module cannot cause any damages for the host or lines of the interface.
2. There cannot be any abnormal visible effects (= Display must be blank) within 1 second on the display and remains blank until "Power On Sequence" powers it up.

10. Power Level Definition

10.1. Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.
In this mode, the display is able to show maximum 262,144 colors.
2. Partial Mode On, Idle Mode Off, Sleep Out.
In this mode part of the display is used with maximum 262,144 colors.
3. Normal Mode On (full display), Idle Mode On, Sleep Out.
In this mode, the full display area is used but with 8 colors.
4. Partial Mode On, Idle Mode On, Sleep Out.
In this mode, part of the display is used but with 8 colors.
5. Sleep In Mode.

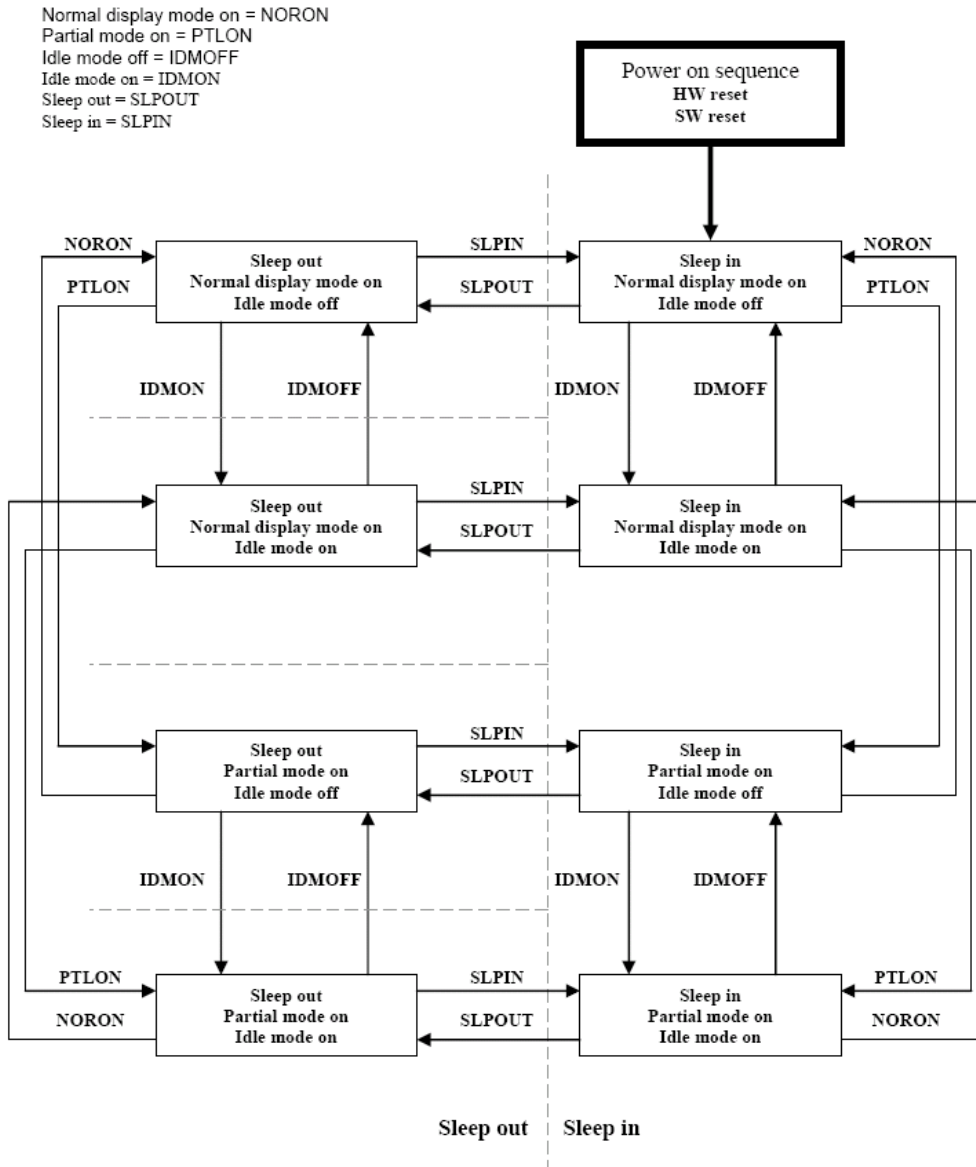

In this mode, the DC:DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

V. .7 Power Off Mode.

In this mode, both VDD and VDDI are removed.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

10.2. Power Flow Chart

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by Nokia, when there is changing from one power mode to another power mode.

11. Gamma Curves

12. Reset

12.1. Registers

The registers that are initialized are listed below.

Reset Table (Default Value, GM=000, 128RGB x 160)

Item	After Power On	After Hardware Reset	After Software Reset
Frame memory	Random	No Change	No Change
Sleep In/Out	In	In	In

12.2. Input/Output Pins

12.2.1 Output Pins, I/O Pins

Output or Bi-direction pins	After Power On	After Hardware Reset	After Software Reset
TE	Low	Low	Low
D17to D0(Output driver)	High-Z(Inactive)	High-Z(Inactive)	High-Z(Inactive)

Note: There will be no output from D[7..0] and SDA during Power On/Off sequences, Hardware Reset and Software Reset.

12.2.2 Input Pins

Input pins	During Power On Process	After Power On	After Hardware Reset	After Software Reset	During Power Off Process
RESX	TBD	Input invalid	Input invalid	Input invalid	?
CSX	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid
D/CX	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid
WRX	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid
RDX	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid
D17 to D0	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid
SDA	Input invalid	Input invalid	Input invalid	Input invalid	Input invalid

12.3. Reset Timing

(VSS=0V, VDDI=1.65V to 1.95V, VDD=2.6V to 2.9V, Ta = -30 to 70°C)

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
tRESW	*1) Reset low pulse width	RESX	10	-	-	-	µs
tREST	*2) Reset complete width	-	-	-	5	When reset applied during Sleep in mode	ms
		-	-	-	120	When reset applied during Sleep out mode	ms

Note

1. Spike due to an electrostatic discharge on RESX line does not cause system reset according to the table below.

RESX Pulse	Action
Shorten than 5μs	Reset Rejected
Longer than 10μs	Reset
Between 5μs and 10μs	Reset starts (It depends on voltage and temperature condtion.)

- During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for Hardware Reset.
- During Reset Complete Time, ID2 and VCOMOF value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 5ms after a rising edge of RESX.
- Spike Rejection also applies during a valid reset pulse as shown below:

- It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

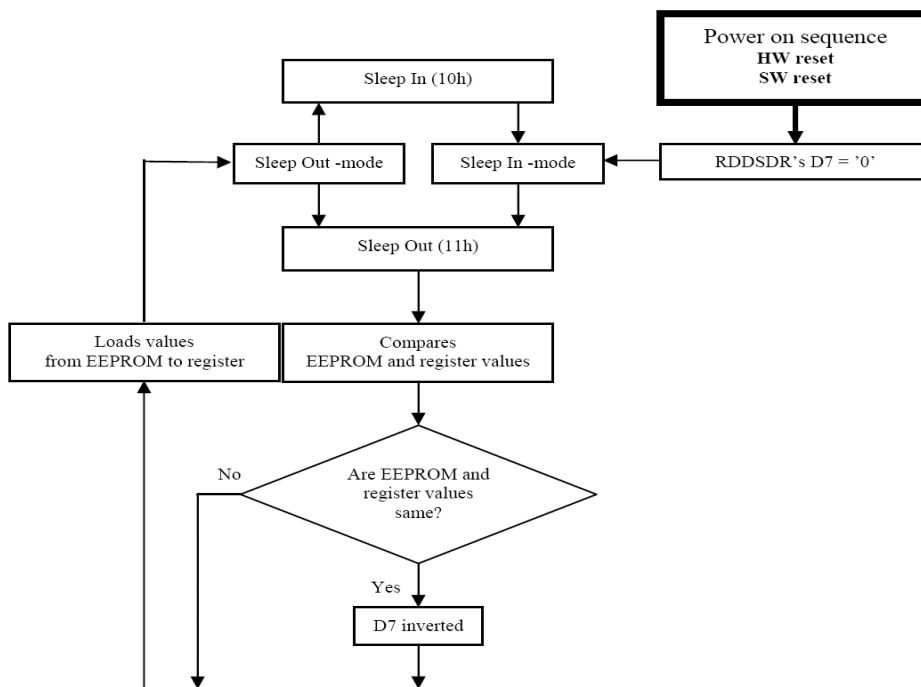

13. SleepOut – Command and Self-Diagnostic Functions of Display

13.1. Register loading Detection

Sleep Out-command (See section 16.1.2.12 Sleep Out (11h)) is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from EEPROM (or similar device) to registers of the display controller is working properly.

There are compared factory values of the EEPROM and register values of the display controller by the display controller. If those both values (EEPROM and register values) are same, there is inverted (= increased by 1) a bit, which is defined in command 16.1.2.10 “Read Display Self-Diagnostic Result (0Fh)” (=RDDSDR) (The used bit of this command is D7). If those both values are not same, the bit(D7) is not inverted (= increased by 1)

The flow chart for this internal function is following:

Note:

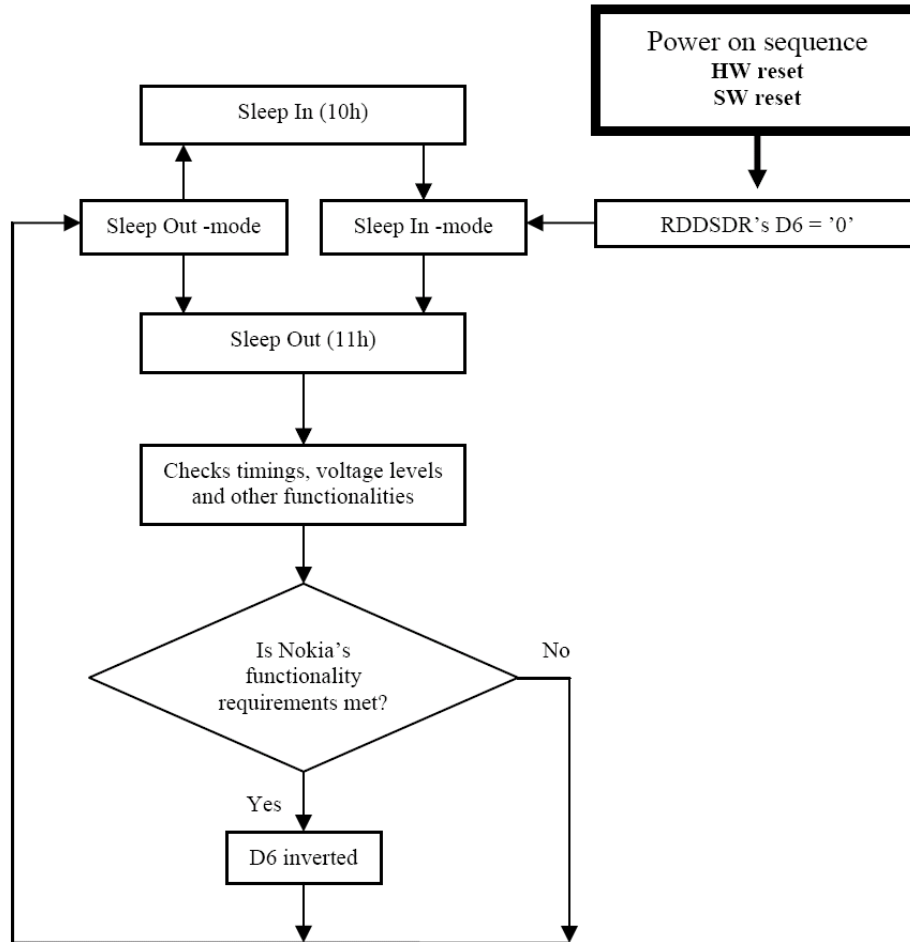

There is not compared and loaded register values, which can be changed by user (00h to Afh and Dah to DDh), by the display module.

13.2. Functionality Detection

Sleep Out-command (See section 16.1.2.12 Sleep Out (11h)) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (only Booster voltage level). If functionality requirement is met, there is inverted (= increased by 1) a bit, which defined in command 16.1.2.10 "Read Display Self-Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (=increased by 1).

The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out –command, when there is changing from Sleep In –mode to Sleep Out –mode, before there is possible to check if Nokia’s functionality requirements are met and a value of RDDSDR’s D6 is valid. Otherwise, there is 5msec delay for D6’s value, when Sleep Out –command is sent in Sleep Out –mode.

14. Command

14.1. Command List

Hex Code	Command	Description	Number of Parameters	Display Architecture Implementation Requirement		
				Type 1	Type 2	Type 3
00h	nop	No Operation	0	Yes	Yes	Yes
01h	soft_reset	Software Reset	0	Yes	Yes	Yes
06h	get_red_channel	Get the red component of the pixel at (0, 0).	1	No	Yes	Yes
07h	get_green_channel	Get the green component of the pixel at (0, 0).	1	No	Yes	Yes
08h	get_blue_channel	Get the blue component of the pixel at (0, 0).	1	No	Yes	Yes
0Ch	get_pixel_format	Get the current pixel format.	1	Yes	Yes	Yes
0Ah	get_power_mode	Get the current power mode.	1	Yes	Yes	Yes
0Bh	get_address_mode	Get the frame memory to the display panel read order.	1	Yes	Yes	Yes
0Dh	get_display_mode	Get the current display mode from the peripheral.	1	Yes	Yes	Yes
0Eh	get_signal_mode	Get display module signaling mode.	1	Yes	Yes	Yes
0Fh	get_diagnostic_result	Get Peripheral Self-Diagnostic Result	1	Yes	Yes	Yes
10h	enter_sleep_mode	Power for the display panel is off.	0	Yes	Yes	Yes
11h	exit_sleep_mode	Power for the display panel is on.	0	Yes	Yes	Yes
12h	enter_partial_mode	Part of the display area is used for image display.	0	Yes	Yes	No
13h	enter_normal_mode	The whole display area is used for image display.	0	Yes	Yes	No
20h	exit_invert_mode	Displayed image colors are not inverted.	0	Yes	Yes	Yes
21h	enter_invert_mode	Displayed image colors are inverted.	0	Yes	Yes	Yes
26h	set_gamma_curve	Selects the gamma curve used by the display device.	1	Yes	Yes	Yes
28h	set_display_off	Blanks the display device.	0	Yes	Yes	Yes
29h	set_display_on	Show the image on the display device.	0	Yes	Yes	Yes
2Ah	set_column_address	Set the column extent.	4	Yes	Yes	No
2Bh	set_page_address	Set the page extent.	4	Yes	Yes	No
2Ch	write_memory_start	Transfer image data from the Host Processor to the peripheral starting at the location provided by set_column_address and set_page_address.	Variable	Yes	Yes	No
2Dh	write_LUT	Fills the peripheral look-up table with the provided data.	Variable	optional	No	No
2Eh	read_memory_start	Transfer image data from the peripheral to the Host Processor interface starting at the location provided by set_column_address and set_page_address.	Variable	Yes	Yes	No
30h	set_partial_area	Defines the partial display area on the display device.	4	Yes	Yes	No
33h	set_scroll_area	Defines the vertical scrolling and fixed area on display device.	6	Yes	No	No
34h	set_tear_off	Synchronization information is not sent from the display module to the host processor.	0	Yes	No	No
35h	set_tear_on	Synchronization information is sent from the display module to the host processor at the start of VFP.	1	Yes	No	No

36h	set_address_mode	Set the read order from frame memory to the display panel.	1	Yes	Yes	Yes
37h	set_scroll_start	Defines the vertical scrolling starting point.	2	Yes	No	No
38h	exit_idle_mode	Full color depth is used on the display panel.	0	Yes	No	No
39h	enter_idle_mode	Reduced color depth is used on the display panel.	0	Yes	No	No
3Ah	set_pixel_format	Defines how many bits per pixel are used in the interface.	1	Yes	Yes	Yes
3Ch	write_memory_continue	Transfer image information from the Host Processor interface to the peripheral from the last written location.	Variable	Yes	Yes	No
3Eh	read_memory_continue	Read image data from the peripheral continuing after the last read_memory_continue or read_memory_start.	Variable	Yes	Yes	No
44h	set_tear_scanline	Synchronization information is sent from the display module to the host processor when the display device refresh reaches the provided scanline.	2	Yes	No	No
45h	get_scanline	Get the current scanline.	2	Yes	Yes	No
Dah	Read ID1					
DBh	Read ID2					
DCh	Read ID3					

Notes:

1. There will be no abnormal visible effects on the display when S/W or H/W Reset are applied.
2. After Powered-On Reset finishes within 10 μ s after both VDD & VDDI are applied.
3. Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

Description	This command turns off sleep mode. In this mode e.g. the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started.																								
Restriction	<p>This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h).</p> <p>It will be necessary to wait 5msec before sending next command; this is to allow time for the supply voltages and clock circuits to stabilize.</p> <p>The display module loads all display supplier's factory default values to the registers during this 5msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when the display module is already Sleep Out –mode.</p> <p>The display module is doing self-diagnostic functions during this 5msec. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.</p> <p>This command has no effect when module is already in sleep out mode.</p> <p>Sleep Out Mode can only be left by HW Reset, Software Reset (01h), Sleep In (10h), or a NMI event trigger.</p>

This command defines the Vertical Scrolling Area of the display.

When MADCTL ML=0

The 1st & 2nd parameter TFA[15...0] describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display).

The 3rd & 4th parameter VSA[15...0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area.

The 5th & 6th parameter BFA[15...0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

TFA, VSA and BFA refer to the Frame Memory Line Pointer.

Description

When MADCTL ML=1

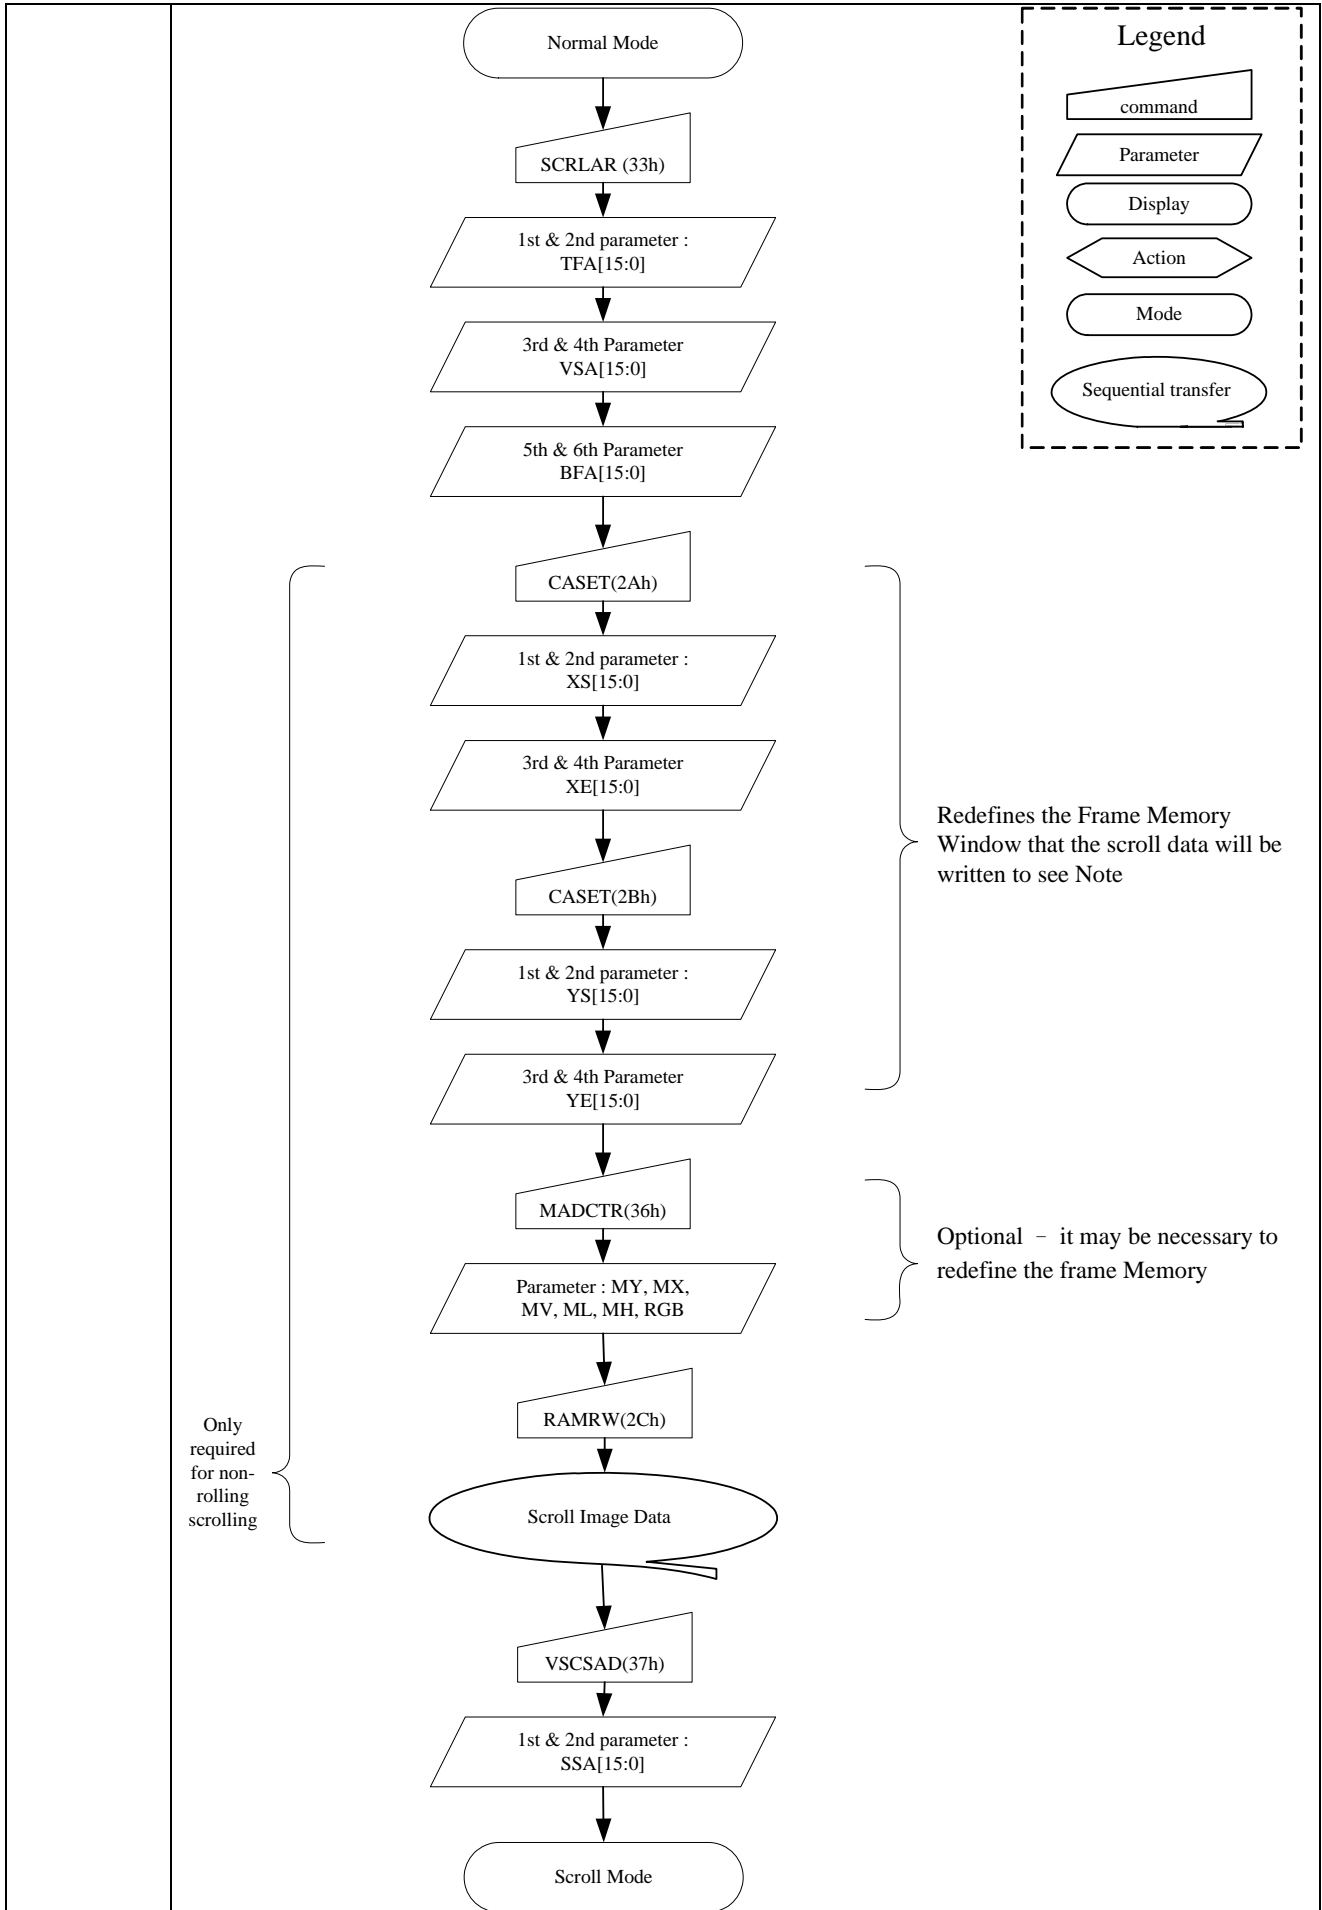

The 1st & 2nd parameter TFA[15...0] describes the Top Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

The 3rd & 4th parameter VSA[15...0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area.

The 5th & 6th parameter BFA[15...0] describes the Bottom Fixed Area (in No. of lines from Top of the Frame Memory and Display).

Restriction	<p>The condition is (TFA+VSA+BFA)=128 in 128RGBx128 (GM="001")</p> <p>The condition is (TFA+VSA+BFA)=130 in 130RGBx130 (GM="100")</p> <p>The condition is (TFA+VSA+BFA)=132 in 132RGBx132 (GM="101")</p> <p>The condition is (TFA+VSA+BFA)=160 in 128RGBx160 (GM="011") or 120RGBx160(GM="010")</p> <p>The condition is (TFA+VSA+BFA)=162 in 132RGBx162(GM="000")</p> <p>Otherwise Scrolling mode is undefined.</p> <p>In Vertical Scroll Mode, MADCTL parameter MV should be set to '0' – this affects the Frame memory Write.</p>

Flow Chart	<p>The flow chart illustrates the execution of the EPWRITE(D7h) command. The command is represented by a trapezoid shape, which points to a large parallelogram representing the parameter data. This data is organized into three rows: '1st Parameter', '2nd Parameter', and '3rd Parameter'. To the right of the flow chart is a legend enclosed in a dashed box, defining the symbols used: a trapezoid for 'command', a parallelogram for 'Parameter', a rounded rectangle for 'Display', an arrowhead for 'Action', an oval for 'Mode', and an oval with an arrow for 'Sequential transfer'.</p>

- RGB filter order = RGB

- Direction default setting(H/W)
SMX = 0
SMY = 0
SRGB = 0

S1 = Filter R
S2 = Filter G
S3 = Filter B

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
-XY- Exchange control by MV

Case 2:

- 1st Pixel is at Left Top of the panel
- RGB filter order = BGR

- Direction default setting(H/W)
SMX = 0
SMY = 0
SRGB = 1

- S1 = Filter B
- S2 = Filter G
- S3 = Filter R

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

Case3:

- 1st Pixel is at Right Bottom of the panel
- RGB filter order = "RGB"

- Direction default setting(H/W)
SMX = 0
SMY = 0
SRGB = 0

- S1 = Filter R
- S2 = Filter G
- S3 = Filter B

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

Case 4:

- 1st Pixel is at Right-Bottom of the panel
- RGB filter order = "BGR"

- Direction default setting(H/W)
SMX = 0
SMY = 0
SRGB = 1

S1 = Filter B
S2 = Filter G
S3 = Filter R

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
-XY- Exchange control by MV

15.2. Application of connection with Different resolution

Case 1 of Resolution (132RGB x 132)(GM[2:0]="101") RAM size=132 x 132 x 18-bits(Used)

Display size = 132RGB x 132

1) Example for SMX=SMY='0'

2) Example for SMX=SMY='1'

GRAM size(132x132x18-bits)

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

Case 2 of Resolution (130RGB x 130)(GM[2:0]="100") RAM size=130 x 130 x 18-bits(Used)

Display size = 130RGB x 130

1) Example for SMX=SMY='0'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 0
- SMY = 0
- SRGB = 0

2) Example for SMX=SMY='1'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

Case 3 of Resolution (128RGB x 160)(GM[2:0]="011") RAM size=128 x 160 x 18-bits(Used)

Display size = 128RGB x 160

1) Example for SMX=SMY='0'

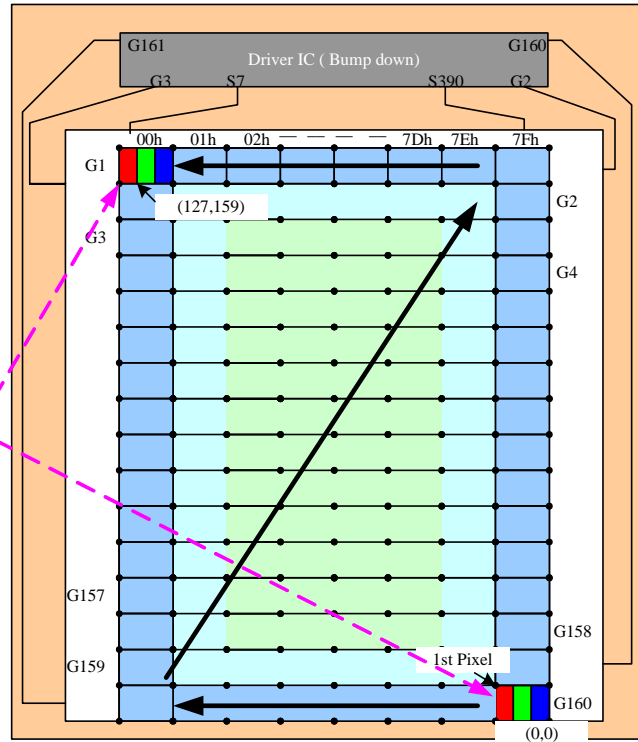

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 0
- SMY = 0
- SRGB = 0

2) Example for SMX=SMY='1'

GRAM size(128x160x18-bits)

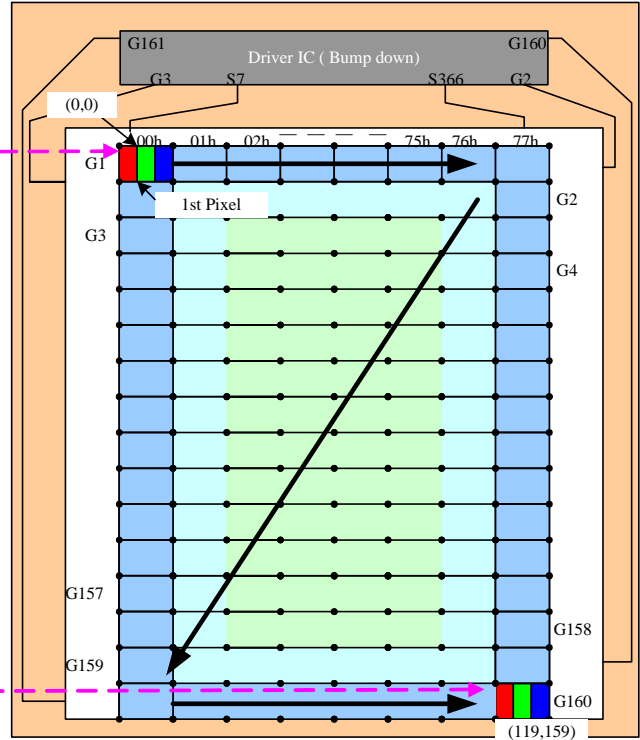

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

Case4 of Resolution (120RGB x 160)(GM[2:0]="010") RAM size=120 x 160 x 18-bits(Used)

Display size = 120RGB x 160

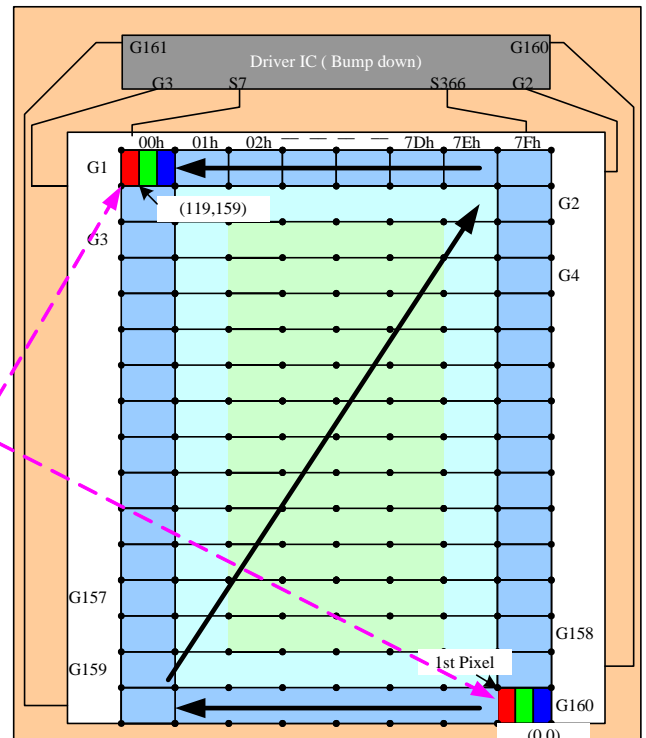

- 1) Example for SMX=SMY='0'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 0
- SMY = 0
- SRGB = 0

2) Example for SMX=SMY='1'

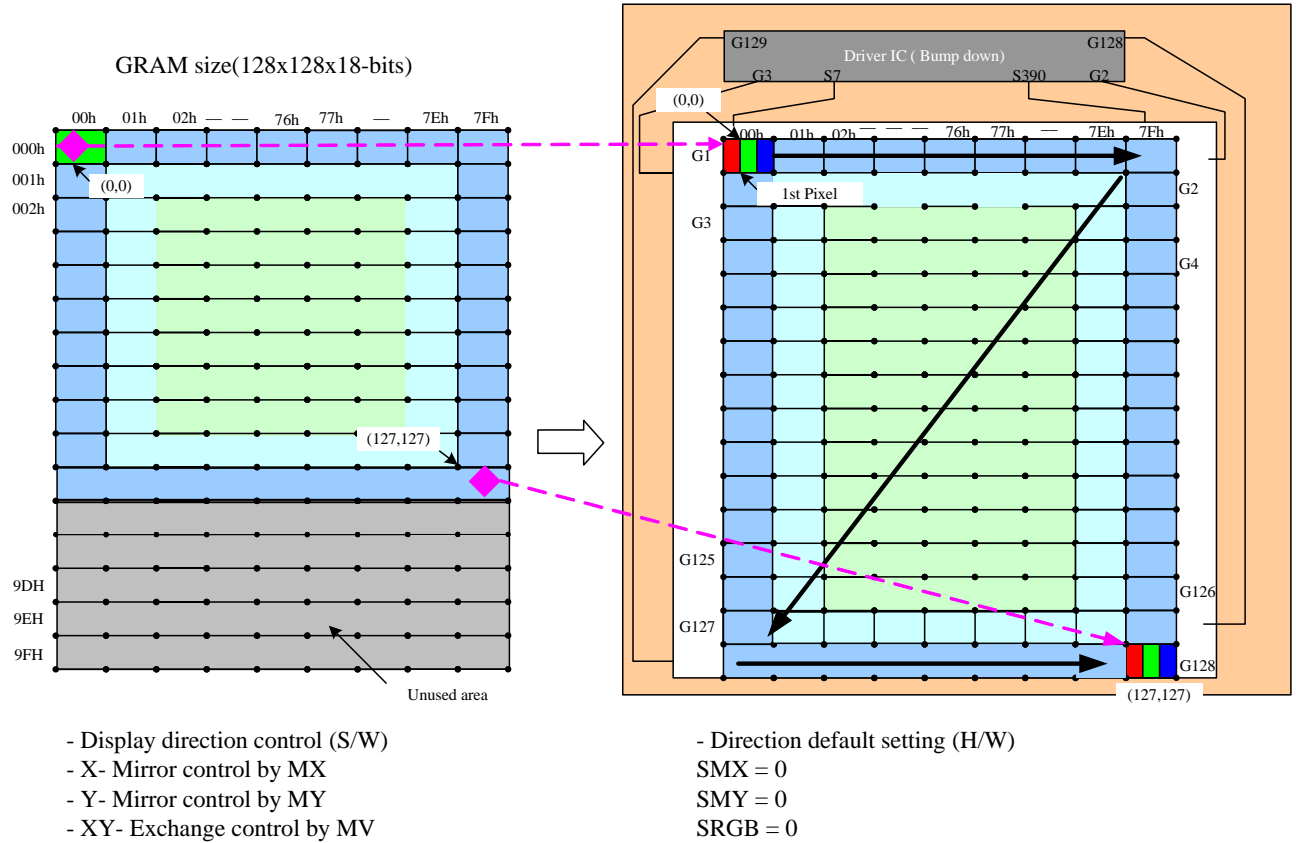

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

Case 5 of Resolution (128RGBx128)(GM[2:0]="001") RAM size=128 x 128 x 18-bits(Used)

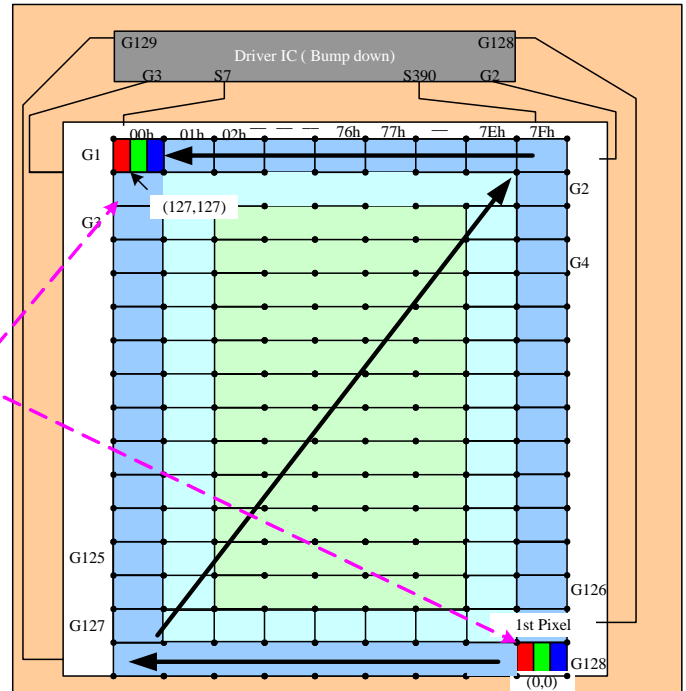

1) Example for SMX=SMY='0'

2) Example for SMX=SMY='1'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

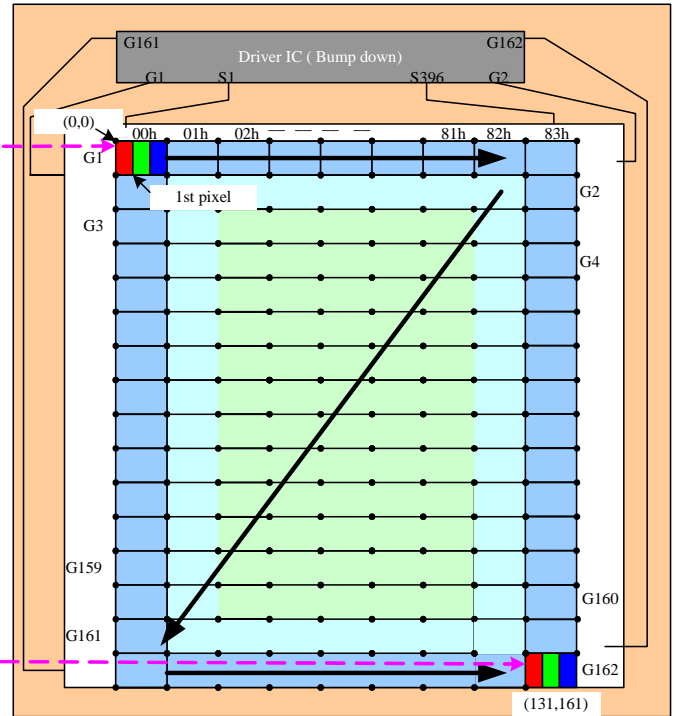

Case 6 of Resolution (132RGB x 162)(GM[2:0]="000") RAM size = 132 x 162 x 18-bits(Used)

Display size = 132RGB x 162

1) Example for SMX=SMY='0'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 0
- SMY = 0
- SRGB = 0

2) Example for SMX=SMY='1'

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

- Direction default setting (H/W)
- SMX = 1
- SMY = 1
- SRGB = 0

16.OTP Programming Flow

17. Electrical Characteristics

17.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When ILI9163 is used out of the absolute maximum ratings, the ILI9163 may be permanently damaged. To use the ILI9163 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the ILI9163 will malfunction and cause poor reliability.

Item	Symbol	Unit	Value Note
Supply voltage	VDD	V	-0.3 ~ + 4.6
Supply voltage (Logic)	VDDI	V	-0.3 ~ + 4.6
Supply voltage (Digital)	VCC	V	-0.3 ~ + 2.4
Driver supply voltage	VGH-VGL	V	-0.3 ~ + 33.0
Logic input voltage range	VIN	V	-0.3 ~ VDDI + 0.3
Logic output voltage range	VO	V	-0.3 ~ VDDI + 0.3
Operating temperature	Topr	°C	-40 ~ + 85
Storage temperature	Tstg	°C	-55 ~ + 110

Notes: If the absolute maximum rating of even is one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

17.2. DC Characteristics

Item	Symbol	Unit	Condition	Min.	Typ.	Max.	Note
Power & Operation Voltage							
Analog Operating voltage	VDD	V	Operating voltage	2.6	2.78	3.3	Note2
Logic Operating voltage	VDDI	V	I/O supply voltage	1.65	1.8/2.78	3.3	Note2
Digital Operating voltage	VCC	V	Digital supply voltage		1.8		Note2
Gate Driver High voltage	VGH	V		10.0		16.0	Note3
Gate Driver Low voltage	VGL	V		-16.0		-9.0	Note3
Driver Supply voltage		V	VGH-VGL	19		32	Note3
Input/Output							
Logic High level input voltage	VIH	V		0.7VDDI		VDDI	Note1,2,3
Logic Low level input voltage	VIL	V		VSS		0.3VDDI	Note1,2,3
Logic High level output voltage	VOH	V	IOH = -1.0mA	0.8VDDI		VDDI	Note1,2,3
Logic High level output voltage	VOL	V	IOL = 1.0mA	VSS		0.2VDDI	Note1,2,3
Logic High level input current	IiH	μA				1	Note1,2,3
Logic Low level input current	IiL	μA		-1			Note1,2,3
Logic input leakage current	IIL	μA	VIN = VDDI or VSS	-0.1		+0.1	Note1,2,3
VCOM Operation							
VCOM High voltage	VCOMH	V	Ccom=12nF	2.5		5.0	Note 3
VCOM Low voltage	VCOML	V	Ccom=12nF	-2.5		0.0	Note 3
VCOM Amplitude voltage	VOMA	V	VCOMH-VCOML	4.0		5.5	Note 3
Source Driver							
Source output range	Vsout	V		0.1		AVDD-0.1	Note4
Gamma reference voltage	GVDD	V		3.0		5.0	Note3
Source output setting time	Tr	μS	Below with 99% precision		15	20	Note4,5
Output deviation voltage (Source output channel)	Vdev	mV	Sout >= 4.2V			20	Note4
			Sout <=0.8V				
Output offset voltage	VOFSET	mV				35	Note8
Booster Operation							
1 st Booster (VDDx2) voltage	AVDD	V		4.5*6		6*7	Note3
1 st Booster(VDDx2) Drop voltage	VDDx2, drop	%	I loading = 1mA			5	Note3
Liner range	VLinear	V		0.2		AVDD-0.2	

Note 1: VDDI=1.65 to 3.3V, VDD=2.6 to 3.3V, AGND=GND=0V, Ta=-30 to 70°C (to +85°C no damage)

Note2: Please supply digital VDDI voltage equal or less than analog VDD voltage. (VDDI ≤ VDD)

Note2,3,4: When the measurements are performed with LCD module. Measurement Points are like below.

Note3: CSX, RDX, WRX, D[23:0], D/CX, RESX, TE, PCLK, VS, HS, DE, SDA, SCL, GM2, GM1, GM0, LCM,RCM1, RCM0, P68, IM2, IM1, IM0, SRGB, REV, SMX, SMY, RL, TB, IDM, SHUT, PREG, GS and Test pins.

Note5: Source channel loading = 10pF/channel, Gate channel loading = 50pF/channel

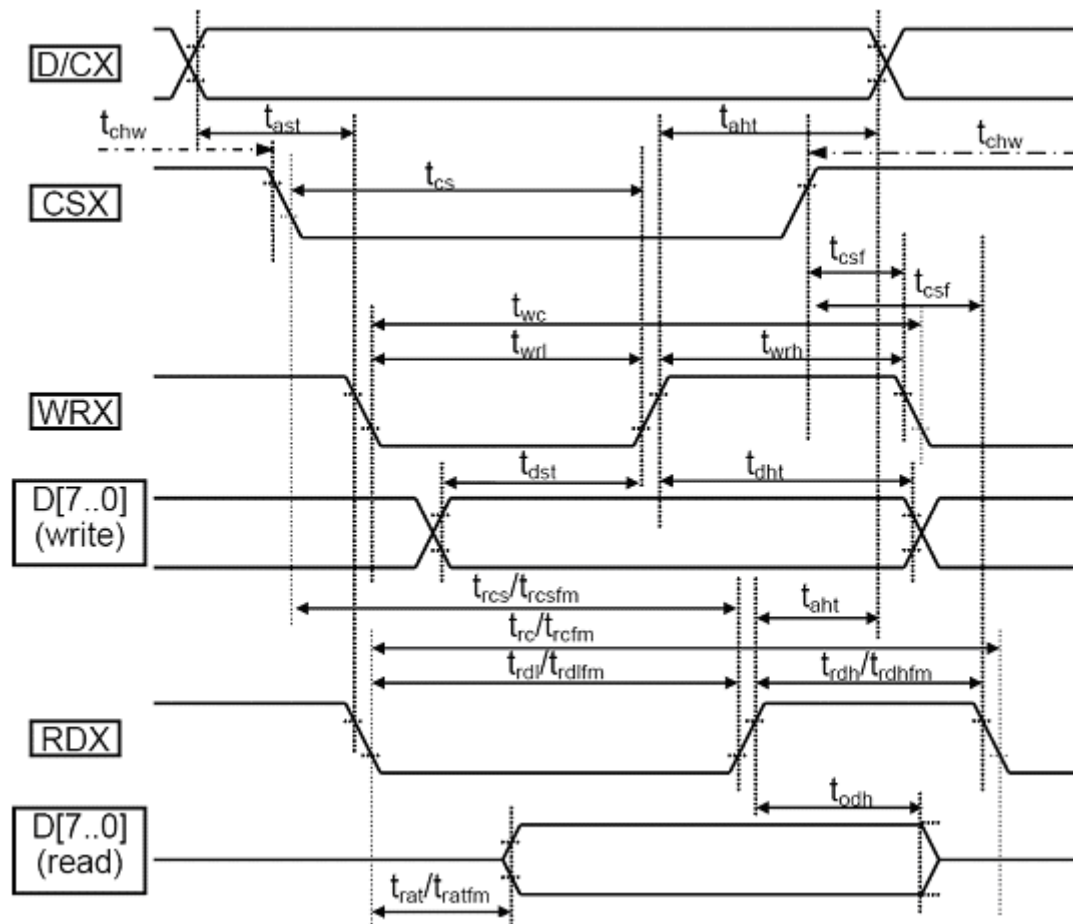

Note6: VDD=2.6V or VCI1=2.6V

Note7: VDD=3.3V or VCI1=3.3V

Note8: The Max. value is between with Note 4 measure point and Gamma setting value.

17.3. AC Characteristics

17.4. Display Module Parallel 18/16/9/8-bit Bus

Note: Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

Table 17.4.1 AC characteristics of parallel CPU I/F in asynchronous mode

Signal	Symbol	Parameter	min	max	unit	description
D/CX	t _{ast}	Address setup time	0		ns	
	t _{ahh}	Address hold time(Write/Read)	10		ns	
CSX	t _{chw}	"S" or "H" Pulse Width	0		ns	
	t _{cs}	Chip Select setup time (Write)	10		ns	
	t _{rhc}	Chip Select setup time (Read ID)	45		ns	
	t _{rhcsm}	Chip Select setup time (Read FM)	355		ns	
	t _{csf}	Chip Select Wait time(Write/read)	10		ns	

WRX	twc	Write cycle	66		ns	
	twrh	Control pulse H duration	15		ns	
	twrl	Control pulse L duration	15		ns	
RDX	trc	Read cycle (ID)	160		ns	When read ID data
	trdh	Control pulse H duration(ID)	90		ns	
	trdl	Control pulse L duration(ID)	45		ns	
RDX	trcfm	Read cycle (FM)	450		ns	When read from frame memory
	trdhfm	Control pulse H duration (FM)	90		ns	
	trdlfm	Control pulse L duration (FM)	355		ns	
D[17..0]	tdst	Data setup time	10		ns	For maximum CL = 30pF For minimum CL = 8pF
	tdht	Data hold time	10		ns	
	trat	Read access time (ID)		40	ns	
	tratfm	Read access time (FM)		340	ns	
	todh	Output disable time	20	80	ns	

Note 1: VDDI 1.65 to 3.3V, VDD=2.6 to 3.3V, AGND=GND=0V, Ta=-30 to 70 °C (to +85°C no damage)

Note 2: This input signal rise time and fall time (tr, tf) is specified at 15 ns or less. Logic high and low levels are specified as 30% and 70% of VDDI for input signals

17.5. Display Serial Interface

17.5.1 3-pin Serial Interface

Table 17.5.1.1: 3-pin Serial Interface Characteristics

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
CSX	TCSS	Chip select setup time	15		ns	
	TCSH	Chip select hold time	60		ns	
	TCHW	Chip select setup time	40		ns	
SCL	TSCYCW	Serial clock cycle(Write)	66		ns	

	TSHW	S“L”“H” pulse width(Write)	1		ns	
	TSLW	S“L”“L” pulse width(Write)	15		ns	
	TSCYCR	Serial clock cycle(Read)	150		ns	
	TSHR	S“L”“H” pulse width(Read)	60		ns	
	TSLR	S“L”“L” pulse width(Read)	60		ns	
SDA(DIN) (DOUT)	TSDS	Data setup time	10		ns	
	TSDH	Data hold time	10		ns	
	TACC	Access time	10	50	ns	For maximum CL = 30pF
	TOH	Output disable time	15		ns	For minimum CL = 8pF

Note 1: VDDI=1.65 to 3.3V, VDD=2.6 to 3.3V, AGND=GND=0V. Ta=-30 to 70°C (to +85°C no damage)

Note 2 : The input signal rise time and fall time(tr, tf) is specified at 15 ns or less.

Logic high and low levels are specified as 10% and 90% of VDDI for Input signals.

17.5.2 4-pin Serial Interface

Table 6.1.3.2: 4 pin Serial Interface Characteristics

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
CSX	T _{css}	Chip select setup time	15		ns	
	T _{csH}	Chip select hold time	60		ns	
	T _{chW}	Chip select setup time	40		ns	
SCL	T _{scycW}	Serial clock cycle(Write)	66		ns	
	T _{shW}	S“L”“H” pulse width(Write)	1		ns	
	T _{slW}	S“L”“L” pulse width(Write)	15		ns	
	T _{scycR}	Serial clock cycle(Read)	150		ns	
	T _{shR}	S“L”“H” pulse width(Read)	60		ns	

	TSLR	S“L”“L” pulse width(Read)	60		ns	
D/CX	TDCS	D/CX setup time	7		ns	
	TDCH	D/CX hold time	7		ns	
SDA(DIN) (DOUT)	TSDS	Data setup time	10		ns	
	TSDH	Data hold time	10		ns	
	TACC	Access time	10	50	ns	For maximum CL = 30pF
	TOH	Output disable time	15		ns	For minimum CL = 8pF

Note 1: VDDI=1.65 to 3.3V, VDD=2.6 to 3.3V, AGND=GND=0V. Ta=-30 to 70°C (to +85°C no damage)

Note 2 : The input signal rise time and fall time(tr, tf) is specified at 15 ns or less.

Logic high and low levels are specified as 10% and 90% of VDDI for Input signals.

17.6. Reset Timing Characteristics

Reset Timing Characteristics (VDDI = 1.65 ~ 3.3 V)

Item	Symbol	Unit	Min.	Typ.	Max.
Reset low-level width	t_{RES}	ms	1	-	-
Reset rise time	t_{rRES}	μ s	-	-	10

18.Revision History

Version No.	Date	Page	Description
V.01	2007/08/30		New Created
V0.11	2007/10/8	P177 P151	Add Ch15 : Example Connection with Panel direction and Different Resolution Modify Interanal Oscillator
V0.13	2007/11/01	16, 20	Modify the input pad size and input pad coordination
V0.14	2007/11/28	85,86,89,121 123,166	Modify HEX
		106,146,150	Modify Parameter
		112,135,138, 139,141,143	Modify RDX/WRX
		146	Modify Descirption – internal oscillator 1 Modify PTG[1:0] to PTG[0]
		147	Modify PT[1:0] VCOM output on non-display area
		152,185	Modify AVDD, VCL
		177,178,181 183,	Modify SMX/SMY=1
		184	Add OTP Programming Flow
V0.15	2008/03/17	All	Remove RGB Interface
		14	Modify Chip Thickness 300um → 280um Modify Pad Height 90um → 75um
V0.16	2008/03/28	13,189	Remove VCC
		10,11	Add HS/VS/PCLK/DE/TB/RL Definition
V0.17	2008/05/07	35	Update RGB Interface
V0.18	2008/07/24	All	Remove RGB Interface
