End-of-shaft sensing

You know the benefits of contactless rotary position sensors—long-life and high accuracy. But finding a drop-in contactless alternative to your existing contacting solution can be a struggle.

To give you the flexibility you need, we've created **Phier Service**.

We'll customise anything for you from our off-the-shelf magnetic Hall effect range.

Revolutionary thinking

Play resistant

The **variable gap** sensor creates immunity to radial and axial play on mobile shafts where significant misalignment results in poor operational performance and labour intensive maintenance programmes.

A round or arc magnet (where 360° rotation angle is unnecessary) is attached to rotating parts of kit, such as boom loaders, skid steer buckets and hitch arms, and the electronics module to the chassis (or vice versa). Here, Phier separates the magnet from the electronics module.

- + Any arc magnet diameter
- + 3 +/- 2 mm air-gap distance
- + Harsh environment sealing
- + Possibility to customise the air-gap distance

Touchless magnetic

Our touchless sensors feature two independent mechanical modules containing the target magnet and the sensor electronics positioned as an on-shaft configuration. The sensor is a truly contactless sensor due to there is not physical connection between the electronics (stationary element) and the target magnet (moving element). This type of sensor provides the same precision as one piece sensors and allows both **Rotary** and **Linear** sensing strokes.

Something that is easy to assemble – less sensitive to the application shaft's axial and radial plays - delivering additional cost reduction on the production assembly.

Designed to be fitted in harsh environment applications such as Off-highway and Marine due to the fully sealed electronics and magnet.

- + Truly contactless
- + Precision and stability
- + Easy to assemble
- + Rotary and linear displacement feedback
