## 32-bit MCUs Terminology

Timing and Measurements: Signal Measurement with Timing and Counter Control	
TCC: Timer/Counters for Control	Selected SAM products have TCCs for applications like Switch Mode Power Supplies (SMPS), lighting and motor control. The TCCs support up to 96 MHz and 24-bit resolution.
QEI: Quadrature Encoder Interface QDEC: Quadrature Decoder	QEI to increment encoders for obtaining mechanical position data typical for automation or motor control applications. QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.
Safety and Monitoring: Hardware Monitoring and Fault Detection	
DMT: Dead Man Timer	The primary function of the DMT is to reset the processor in the event of a software malfunction. A DMT is typically used in mission-critical and safety-critical applications, where any single failure of a software functionality and sequencing must be detected.
Communications: General, Industrial, Lighting and Automotive	
SERCOM: Serial Communication Module	The SERCOM is software that is configurable to operate as I <sup>2</sup> C, SPI or USART, giving you extended flexibility to mix serial interfaces and greater freedom in PCB layout. Each SERCOM instance can be assigned to different I/O pins through I/O multiplexing, further increasing versatility.
I <sup>2</sup> S: Inter-IC Sound Controller	The Inter-IC Sound Controller provides a bidirectional, synchronous digital audio link with external audio devices.
PMP: Parallel Master Port EBI: External Bus Interface	PMP/EBI provide a high-speed and convenient interface to external parallel memory devices, graphic LCDs and camera sensors.

User Interface: Capacitive Touch Sensing and LCD Control	
PTC: Peripheral Touch Controller	An embedded peripheral touch controller makes it easy to add capacitive touch sensing to your project with buttons, sliders, wheels and proximity. By offering superb sensitivity and noise tolerance as well as self-calibration, the PTC eliminates the need for external components and minimizes CPU overhead. The PTC supports up to 256 channels on 64-pin devices, 120 channels on 48-pin devices and 60 channels on 32-pin devices.
System Flexibility: System Peripherals and Interconnects	
CLO/CCL: Configurable Custom Logic	The CCL is a programmable logic peripheral which can be connected to the device pins, events or to other internal peripherals. This allows you to eliminate logic gates for simple glue logic function on the PCB.
EVSYS: Event System	The Event System allows autonomous, low-latency and configurable communication between peripherals. Several peripherals can be configured to generate and/or respond to signals known as events. Communication is made without CPU intervention and without consuming system resources such as bus or RAM bandwidth. This reduces the load on the CPU and other system resources, compared to a traditional interrupt-based system.
Dual Panel/Bank Flash	Dual Bank Flash allows live field firmware/program update on one bank while CPU can continue executing code from another Flash bank.
